FACILITY

The Ohio State University (OSU) Soil Water Environmental Laboratory is located at 2021 Coffey Rd., Columbus OH, 43210 in the School of Environment and Natural Resources. The facility exists to meet the needs of research grants, individuals, companies, state and federal agencies in regard to physical and chemical analysis of soil, water, plant, and other environmental samples. Professor Nick Basta, Director

SCOPE OF WORK

As part of Phase II of the Soil Amendment Technology Evaluation Study (SATES), OSU performed analysis required to characterize soils and amendments for baseline and Time Points 1-3 (T1-T3), which includes controls and treatments, according to Table 6-2 of the Phase II Work Plan (Ramboll Environ, 2019).

METHODS

Treatments were created, samples collected, and processed according to the Phase II Work Plan (Ramboll Environ, 2019).

Time Points 1-3 Sample Analysis

Samples were analyzed for pH according to Thomas (1996), electrical conductivity/salinity according to Rhoades (1996) which is consistent with APHA method 2510. Baseline samples (<2mm size fraction) and amendments were analyzed for total elemental (TAL metals except Hg) content by acid digestion using USEPA Method 3051A (USEPA, 2007a) followed by USEPA Method 6010C (USEPA, 2007b). Additionally, baseline samples and T1-T3 were analyzed for total arsenic and lead content using the <150µm size fraction by acid digestion using USEPA Method 3051A (USEPA, 2007a) followed by USEPA Method 6010C (USEPA, 2007b). Total carbon and nitrogen was conducted on baseline and T1-T3 according to Neslon and Sommers (1996), and total nitrogen according to Bremner (1996). Bioaccessible arsenic and lead was conducted on the <150µm size fraction for baseline and T1-T3 according USEPA Method 9200 (2008) at pH 1.5 as well as at pH 2.5 for followed by USEPA Method 6010C (USEPA, 2007b). Mehlich 3 extractable phosphorus and lead was conducted on the <2mm soil size fraction for baseline and T1-T3 (Mehlich, 1984) by USEPA Method 6010C (USEPA, 2007b). Potentially leachable TAL metals (except Hg) was conducted on the <2mm soil size fraction for baseline and T1-T3 according by SPLP according to USEPA Method 1312 (USEPA, 2007c) followed by USEPA Method 6010C (USEPA, 2007b). Mineralizable Nitrogen was conducted on the <2mm soil size fraction for baseline and T1-T3 according to Waring and Bremner (1964). Total Organic Carbon was conducted on the <2mm soil size fraction for baseline and T1-T3 according to Heanes 1984). Soil moisture holding capacity was determined on bulk baseline and treatments according to Cassel and Nielsen (1986). Adjustment of soil moisture was conducted on bulk treatments and controls by direct gravimetric measurement.

QUALITY CONTROL

Quality Control Measures

Control Soils: A certified reference material or laboratory reference material that goes through the same extraction/preparation procedure as the samples. The analyte composition of the laboratory control sample is known included in each sample preparation batch.

Matrix Spike: A duplicate sample is spiked with a known analyte concentration prior to extraction and run through the complete procedure in order to provide information about the effect of the sample matrix on the measurement methodology.

Reagent Blank: The Reagent Blank is a sample that contains only the reagents used in the extraction procedure. The preparation blank is processed through the same preparation procedures as the samples and therefore gives an indication of any contamination picked up during the sample preparation process.

Duplicate sample: A duplicate of one sample per batch is processed through the same preparation procedures as the samples to determine reproducibility within each batch.

Reporting Limit: Reporting limit (RL) is set at the lowest concentration in a calibration curve with an independently calculated accuracy of +/- 15%.

Method Detection Limit: Method detection limits (MDL) are calculated for specific methods and consequent conditions of that method developed for analysis on ICP. The method detection limit is determined as three times the standard deviation of the signal of 10 blanks solutions.

Quality Control Limits and Flags

Control Soils

- Recovery: +/- 20% or within prediction interval of certified value
- Flag: crm
- Frequency: 1/batch

Matrix Spike

- Recovery: +/- 25%
- Flag: spk
- Frequency: 1/batch

Reagent Blank

- Method blank <RL or <10X sample concentration
- Flag: blk
- Frequency: 1/batch

Duplicate Sample

- Duplicate relative percent difference +/- 20%
- Flag: dup
- Frequency: 1/batch

Reporting Limit

- Analyte concentration > RL
- Flag: RL
- Frequency: Every Sample

Method Detection Limit

- Analyte concentration >MDL
- Flag: MDL
- Frequency: Every Sample

Between MDL and RL

- If an analyte concentration is between >MDL and <RL, a flag will be assigned to denote this occurrence
- Flag: rl
- Frequency: Every Sample

Hold Time

- Hold times were established in Phase I Work Plan (Ramboll Environ, 2017). The only analysis under this scope of work that has USEPA Contract Laboratory Program (CLP) designated hold times is for TAL metals (USEPA, 2014). The hold times in the Phase I work plan are more conservative than the 180 days designated for metal analysis under the USEPA CLP. As a result, while hold times may be exceeded for some analysis under the current statement of work, the results are valid and in no way impact the *Soil Amendment Technology Evaluation Study* data quality objectives.
- Flag: ht

SAMPLE RESULTS

Table 1. Summary statistics for Timepoint 1 bioaccessible arsenic and lead (pH 1.5 and pH 2.5) in mg/kg for each treatment/rate/application method combination
