1 INTRODUCTION

This document presents a summary report of fish biological measurements and tissue results conducted under the Quality Assurance Project Plan (QAPP) for the 2009 Fish Tissue Study (TAI 2009). This study was conducted as part of the Upper Columbia River (UCR) Remedial Investigation and Feasibility Study (RI/FS).

Primary objectives of the RI/FS are to investigate the nature and extent of unacceptable risk at the Site¹, provide information to support baseline risk assessments for human health (to be completed by the U.S. Environmental Protection Agency [EPA]) and the environment (to be completed by Teck American Incorporated [TAI]), and to develop and evaluate potential remedial alternatives for the Site (USEPA 2008). Fish tissue sampling was conducted from September 28th to October 18th, 2009 to collect data necessary for completion of the ecological and human health risk assessments. During the study, tissues were collected from several fish species and size classes within six fish collection areas of the UCR in accordance with the 2009 QAPP (TAI 2009).

1.1 BACKGROUND

A review of historical fish tissue data collected within the UCR identified several potential data gaps for evaluating ecological and human health risks (TAI 2009). For example, the historical data set lacked information for describing concentrations of chemicals of interest (COIs) in small- to medium-sized fish (i.e., ≤ 30 cm) throughout the site. In addition, COI concentrations had not been collected in fillet tissues of some key large-sized fish (>30 cm), such as kokanee and smallmouth bass. The primary objective of the 2009 fish tissue study was to collect information on chemical concentrations in fish tissues to fulfill the data needs identified in the QAPP (TAI 2009). This report summarizes the data collected and identifies if the Data Quality Objectives (DQOs) of the QAPP have been met. This report does not evaluate potential risks nor does it consider other relevant data (e.g., 2005 fish tissue). Such evaluations will be performed and detailed within the Human Health and Baseline Ecological Risks Assessments accordingly. During that time and consistent with Guidance (USEPA 1997), should EPA determine that there is insufficient information to support informed risk-based management decisions, additional fish tissue data may be needed.

¹ The UCR site as defined within the June 2, 2006 Settlement Agreement is the areal extent of hazardous substances contamination within the United States in or adjacent to the Upper Columbia River, including the Franklin D. Roosevelt Lake, from the U.S.–Canada border to the Grand Coulee Dam, and those areas in proximity to the contamination which are suitable and necessary for implementation of response actions.

1.2 REPORT ORGANIZATION

This report is organized into the following sections:

- **Section 1—Introduction.** This section describes the purpose and objectives of the 2009 fish tissue program.
- **Section 2—2009 Fish Tissue Study.** This section provides an overview of the 2009 fish tissue program, including: target species; target tissue types; target sample locations; collection methods; how individual fish were assigned to composite samples; and how composite samples were prepared prior to submission to the laboratory.
- **Section 3—Quality Assurance Project Plan Modifications and Deviations.** This section discusses any deviations from the QAPP and sampling plan presented in the QAPP.
- **Section 4—Validation Assessment.** This section provides an overview of the validation assessment conducted on the analytical results of the fish tissue samples.
- **Section 5—Summary of Available Data.** This section presents a summary of the analytical data available from the 2009 fish tissue samples.
- **Section 6—Assessment of Data Gaps.** This section presents an analysis of data gaps in the fish tissue results.
- **Section 7—Summary and Recommendations.** This section presents a summary of the fish tissue results in terms of data gaps and provides recommendations.
- **Section 8—References.** This section presents bibliographic information for the documents cited within this report.

In addition to the above-listed and associated appendices, data tables presented herein have been provided in electronic format, including the raw data (see enclosed CD-ROM). Data may also be obtained directly from the Project Database, accessible at <http://teck-ucr.exponent.com>.

2 2009 FISH TISSUE STUDY

2.1 PURPOSE OF STUDY

The purpose of the 2009 fish tissue study was to collect information on chemical concentrations in fish tissues to fulfill the data needs identified in the QAPP (TAI 2009).

2.2 DATA QUALITY OBJECTIVES

As described in the QAPP (TAI 2009), EPA's seven-step DQO process (USEPA 2006) was used to guide the design rationale for the fish tissue study. The DQO process is a tool to determine the type, quantity, and quality of data. This process establishes performance and acceptance criteria for the data to promote achievement of study goals. A review of the DQOs for the 2009 Fish Tissue Study is necessary for the data gap analysis (Section 6).

2.2.1 State the Problem

The preliminary conceptual site model (CSM) for the UCR RI/FS identified consumption of fish tissue as a potential exposure pathway for piscivorous fish and wildlife, and people. A relatively large amount of information has previously been collected on characteristics of the UCR fish community and major species (see the QAPP [TAI 2009] for a full discussion on existing data). The fish tissue study conducted by EPA in 2005 (USEPA 2007), as well as several earlier studies, identified the presence of COIs in fish tissues. Despite this large amount of existing information, a number of data gaps remained. For example, the EPA 2005 study evaluated large fish (13 to 22 in. [33 to 56 cm]). Although these data are useful in evaluating potential risks to people, they are less useful for evaluating potential risks to ecological receptors that prey largely or entirely on smaller fish. The 2009 fish tissue study is intended to supplement the 2005 data set and provide additional data that supports both the ecological and human health baseline risk assessments. Specifically, the 2009 fish tissue study collected additional fish species, target size classes, and COI tissue concentration data to adequately estimate risks posed by COIs to piscivorous fish, wildlife receptors, and people. In addition to collecting fish smaller than 13 in., the 2009 fish tissue study repeated the collection of large-sized fish (>30 cm) collected by EPA in 2005 to expand and enhance the data set.

2.2.2 Identify the Goal of the Study

The goal of this study is to support a decision of whether potential remedial actions are warranted due to unacceptable risks posed by the COIs to fish and piscivorous wildlife in the UCR. EPA may choose to use these data in support of similar objectives for the Human Health Risk Assessment (HHRA).

Specific risk-related questions that will be addressed through collection of data on concentrations of COIs in fish tissues are:

- Will reproduction, growth, or survival of aquatic-associated wildlife be adversely affected by the concentration of COIs in the fish consumed from the Site?
- Will growth, reproduction, or survival of fish be adversely affected by the concentration of COIs in their bodies or in prey fish?
- Will the health of recreational anglers or subsistence harvesters be adversely affected when they consume fish caught from within the Site and, if so, which species and size classes are contributing the most to risk estimates?

2.2.3 Identify Information Inputs

Step 3 of the DQO process (USEPA 2006) requires consideration of:

- Types and potential sources of information (e.g., site characteristics or variables) that should be measured to provide estimates or resolve decisions
- Information to provide a basis for specifying performance or acceptance criteria
- Information on the performance of appropriate sampling and analyses methods.

Determination or estimation of potential risks to piscivorous fish and wildlife requires representative data for COIs in Site fish tissue, knowledge about the size and species of fish preferred by various feeding guilds, knowledge about species and size of fish found in the UCR, and knowledge about fish movement and habitat preference. Existing information with regard to characterizing feeding and habitat preferences, and fish species and sizes at the Site is provided in the QAPP (TAI 2009). Representative COI concentrations from appropriate fish species and size classes were determined through new data collection as set forth in the QAPP (TAI 2009) in combination with data collected by EPA in 2005.

Toxicity benchmarks for fish, wildlife, and people are information inputs to aid in specifying performance or acceptance criteria (i.e., determination of unacceptable risk). Preliminary information with regard to toxicity benchmarks is presented in the QAPP (TAI 2009). Sampling and analytical methods must be appropriate to ensure that chemical measures of exposure can be properly estimated and compared to toxicity benchmarks or other acceptance criteria. Analytical procedures used for this study are standard EPA approved analytical protocols (Table 2-1) with detection limits sufficiently low to provide concentration data that are below risk-based benchmarks (Table 2-2; discussed later in this section).

In addition, the sampling scheme must be sufficiently robust to allow for statistical analyses that have a low probability of both Type I and Type II errors² and to provide adequate exposure concentration estimates.

Feeding Preferences for Wildlife

Three size classes (≤ 15 cm, >15 to ≤ 30 cm, and >30 cm) were selected to differentiate diets among wildlife feeding guilds. The relative importance of various sizes of fish in the diet of these representative wildlife species are shown in Table A-6 of the QAPP (TAI 2009). It is recognized that some fish in each size class will be fully grown adults while others will be juveniles or younger fish of species that grow to a much larger size. While this may confound the assessment of risks to fish, age analysis (through otolith measurements) could provide information that can inform the risk assessment and reduce uncertainty. The age of fish is less relevant for wildlife dietary analyses, as birds and mammals primarily key on fish size and will eat whatever is catchable within that size range. Collection of at least some of the same species in different size classes will aid in comparisons among fish age groups should questions about increasing contamination with age need to be addressed.

Species and Sizes of Fish in the UCR

Table A-7 of the QAPP (TAI 2009) lists fish species (and some life history characteristics) known to inhabit the UCR, and Table A-8 of the QAPP (TAI 2009) presents the relative abundance of these species.

Wildlife Prey Species

To develop data needed to assess exposure to piscivorous wildlife, several abundant fish species were collected as species-specific composite samples for each of the three size classes described above. Fish species sampled at each location included fish from several different feeding guilds to represent varying exposure conditions. Thus, target fish species were intended to be representative of food types consumed by wildlife inhabiting the UCR.

Fish Prey Species

To develop data needed to assess exposure to piscivorous fish, representative species of major fish feeding guilds (e.g., insectivores and omnivores) were chosen. Fish tissue will be used to characterize exposure to piscivorous fish via ingestion, and exposure of fish to organic substances, using concentrations in whole fish samples.

² A Type I error incorrectly concludes that there is a risk when there really is not; a Type II error incorrectly concludes that there is no risk when there really is risk.

Fish Species Consumed by People

Species most relevant to the assessment of risk to people are those that are generally caught by recreational anglers and harvested for subsistence purposes. Fish abundance surveys and creel surveys have indicated that anglers frequently target walleye, rainbow trout, lake whitefish, kokanee, burbot, and largescale sucker. In addition, smallmouth bass are increasing in numbers and are becoming a larger proportion of the recreational fishery. White sturgeon fishing is closed in the UCR, including Lake Roosevelt. While it is anticipated that people will likely target larger fish (>30 cm), catch limits do not prohibit collection and consumption of smaller fish.

For the 2009 fish tissue study, analyses on larger fish were conducted on fillets (with skin) and on the remainder of the fish. The remainder is all remaining portions of the fish after the fillets are removed. Fillets and the remainder were weighed separately because chemical analyses were performed on these tissues in separate composites. Whole body concentrations were calculated from these separate composites (discussed in Section 2.3.2). Guts of benthivorous fish (i.e., those that feed from the sediment) may contain sediment, which could bias results of the tissue analysis. Therefore, gut contents of the largescale and longnose suckers (benthivorous fish) were removed prior to chemical analysis.

Analytical Concentration Goals – Benchmarks Used

Toxicity benchmarks are used as risk-based concentrations (RBCs) to establish analytical concentration goals to ensure that analytical detection limits are sufficiently low to provide data that can be used in the ecological and human health risk assessments. These RBCs are purposefully conservative and may not be the final toxicity reference values (TRVs) or reference dose (RfD) used in the risk assessments. Benchmarks used for the fish tissue chemistry are detailed in the QAPP (TAI 2009) and summarized in Table 2-2 of this report.

2.2.4 Define Site Boundaries

The Site encompasses the UCR from the U.S.-Canada border (river mile [RM] 745) to the Grand Coulee Dam (approximately RM 596). For purposes of the fish tissue sampling program, and consistent with the RI/FS Work Plan (USEPA 2008) and Screening Level Ecological Risk Assessment (SLERA) (TAI 2010a) the Site was divided into six reaches:

- Reach 1 (U.S.-Canada border at RM 745 to RM 730)—riverine
- Reach 2 (RM 730 to RM 712)—transitional (riverine to lacustrine)
- Reach 3 (RM 712 to RM 700)—Marcus Flats [transitional (riverine to lacustrine)]
- Reach 4 (RM 700 to RM 640)—lacustrine

- Reach 5 (RM 640 to RM 617)—lacustrine
- Reach 6 (RM 617 to Grand Coulee Dam near RM 596)—lacustrine.

The approach used for the 2009 fish tissue study was to collect fish from the same six Fish Sample Collection Areas (FSCAs) used in 2005 (USEPA 2007), see Map 2-1.

2.2.5 Identify the Analytical Approach

Step 5 of the DQO process provides the analytical approach for evaluating fish tissue data and drawing conclusions on exposure to COIs in this medium. Concentrations of COIs in fish tissue will be used to estimate dietary exposure for fish, wildlife, and people; and for comparison to fish critical body residues (CBRs). This information will be used to support a decision of where or whether a remedial action is warranted due to unacceptable risks posed by the COIs to fish and piscivorous wildlife. Potential remedial actions can be based on the same set of analytical methods identified herein and these methods will use appropriate detection limits (refer to Tables 2-1 and 2-2). This approach will avoid creating a data set invalid for applying a potential action.

Conclusions regarding potential risk to ecological receptors will be made using estimates of exposure compared to toxicity benchmarks (TRVs or RfDs). Exposure assessment may include estimation of the central tendency (e.g., mean concentration) or reasonable maximum concentration (e.g., 95 percent upper confidence level on the mean). Wildlife dietary exposures will be estimated as in the SLERA (TAI 2010a), with fish intake based on appropriate size classes and other site-specific factors. A component of fish exposure will be based on their diet (e.g., for metals) or tissue concentrations relative to critical body residues (e.g., bioaccumulative organic compounds). A potential risk may be indicated using the hazard quotient (HQ) method (e.g., ratio of exposure estimate to the toxicity benchmark); or partial to full probabilistic assessment methods.

2.2.6 Specify Performance or Acceptance Criteria

Step 6 defines performance or acceptance criteria to minimize the possibility of either making erroneous conclusions or failing to keep uncertainty in estimates to within acceptable levels (USEPA 2006). For this study, performance and acceptance criteria applies to generating appropriate and acceptable data for use during risk assessment activities, and providing sufficient data to reduce uncertainty and the probability for false positive (Type I) or false negative (Type II) decision errors.

Sampling and analysis of fish tissues were conducted using standard EPA-approved methods and clean handling techniques. If analytically possible, analytical concentration goals (ACGs) were set below one-fifth the RBC for fish and wildlife, or one-tenth the human health threshold, whichever was lowest (Table 2-2). If ACGs are lower than

method detection limits (MDLs), then the MDL was used as the detection goal. Finally, samples were composited to ensure that sufficient sample mass was acquired to meet the ACGs, and laboratory sample splits from composite homogenates were required to allow for evaluation of analytical variability. Analytical data meeting the ACGs and found within analytical method performance criteria will be considered adequate to answer the questions defined in Step 2.

The estimated sample size and number of fish per composite was selected based on a statistical analysis of fish tissue data collected by EPA in 2005 (Appendix D of the QAPP [TAI 2009]). Based on this analysis, a target sample size of six composites (with five fish per composite) was identified as adequate to detect statistical differences ($\alpha = 0.05$, power = 0.80).

2.2.7 Develop the Plan for Obtaining Data

The final step in the DQO process is the development of a resource-effective design for collecting and processing the proposed samples in a manner that would achieve the specified performance criteria. The plan for obtaining data is described in the Field Sampling Plan (Appendix A of the QAPP [TAI 2009]). In general, a range of fish sizes and species representing varying feeding guilds were targeted in six river reaches of the Site. A broad range of COIs were analyzed in fish tissues to provide additional data for risk assessment purposes.

2.3 STUDY DESIGN

The 2009 fish tissue sampling study targeted locally abundant fish species to provide data to support the ecological and human health risk assessments. The following sections summarize the 2009 fish tissue study design.

2.3.1 Targeted Species and Size Classes

Three size classes and a variety of species were targeted to provide representative data of fish feeding guilds, trophic levels, and prey items for consumers of fish (wildlife and people). The following fish size classes (based on total length) and species were targeted.

≤15 cm Size Class. A goal of six whole body composites (minimum of five fish per composite) consisting of one species per composite was targeted. The goal was to collect six different species from three feeding guilds to achieve representation across guilds.

- Primary species
 - Omnivore—yellow perch
 - Insectivore—rainbow trout
 - Benthivore/detritivore—largescale sucker

- Secondary species
 - Omnivore—bluegill
 - Insectivore—whitefish
 - Benthivore/detritivore—longnose or bridgelip sucker
- Tertiary species (may include)
 - Omnivore—redside shiner, crappie, pumpkinseed, and smallmouth bass
 - Insectivore—pikeminnow
 - Benthivore/detritivore—sculpin.

>15 to ≤30 cm Size Class. A goal of six whole body composites (minimum of five fish per composite) consisting of one species per composite was targeted. Six species from three feeding guilds were targeted to achieve representation across guilds.

- Primary species
 - Benthivore/detritivore—largescale sucker
 - Insectivore—kokanee
 - Piscivore—walleye
- Secondary species
 - Benthivore/detritivore—longnose or bridgelip sucker
 - Insectivore—lake whitefish
 - Piscivore—smallmouth bass
- Tertiary Species (may include)
 - Benthivore/detritivore—sculpin
 - Insectivore—mountain whitefish
 - Piscivore—pikeminnow.

>30 cm Size Class. A goal of six single-species composite samples (minimum of five fish) was targeted for each of the following species.

- Walleye—piscivore
- Burbot—piscivore
- Smallmouth bass—piscivore
- Rainbow trout—omnivore
- Kokanee—insectivore
- Whitefish—insectivore
- Largescale sucker—benthivore/detritivore.

Species collected in this largest size class will provide data primarily for the HHRA; and may be used in the Baseline Ecological Risk Assessment (BERA). Targeted species-specific composites were collected in this size class to represent species commonly sought after by anglers, and to supplement 2005 data (USEPA 2007). A summary of target species and size classes is presented in Table 2-3.

2.3.2 Tissue Types

Whole body samples were targeted for size classes ≤ 30 cm because wildlife and piscivorous fish typically consume the whole body. Fillets of larger fish were collected to provide additional data for the HHRA. Skin-on fillets were collected in 2005 (USEPA 2007) and were also collected in 2009. A summary of target species and size classes from each FSCA is presented in Table 2-3. Tissue types collected for target species were:

≤ 15 cm Size Class

- Whole body samples for all composites

>15 to ≤ 30 Size Class

- Whole body samples for all composites

>30 cm Size Class

- Walleye—fillets (with skin) and remainder³ composites. Consistent with the QAPP (TAI 2009) subsamples from individual walleye fillets were analyzed for total mercury prior to compositing
- Burbot—fillets (with skin) and remainder composites
- Smallmouth bass—fillets (with skin) and remainder composites. Consistent with the QAPP (TAI 2009) subsamples from individual bass fillets were analyzed for total mercury prior to compositing
- Largescale sucker—fillets (with skin) and remainder (without gut contents)
- Rainbow trout—fillets (with skin) and remainder composites
- Kokanee—fillets (with skin) and remainder composites.

Fillets of larger fish were collected to provide additional data for the HHRA and supplement the 2005 data (USEPA 2007). Both of the fillets (composited together) and the remainder (i.e., the carcass or tissue remaining after filleting) were analyzed to allow for reconstruction of whole body concentrations using the following equation:

³ The remainder includes the following components: head, viscera, fins, skeleton, and musculature not obtained with the fillets.

$$C_{ew} = \frac{((C_f \times W_f) + (C_o \times W_o))}{W_f + W_o} \quad \text{(Equation 1)}$$

Where:

C_{ew} = Estimated whole body composite concentration of analyte in wet weight [ww] (mg/kg-ww)

C_f = Concentration in ww of analyte in fillet composite (mg/kg-ww)

W_f = ww of fillet tissue (kg)

C_o = Concentration in ww of analyte in remainder composite (mg/kg-ww)

W_o = ww of remainder tissue (kg)

As specified in Section 2.1.5.7 of the QAPP (TAI 2009), gut contents of large (>30 cm) longnose and largescale suckers (benthivorous fish) were removed prior to chemical analysis so as to not bias tissue results. After a sucker species was filleted, the digestive tract was removed from the head to the anus. The gut was cut open along its full length and the digestive contents extruded into a pre-cleaned glass jar. The guts were rinsed clean with deionized water and the empty digestive tissue was returned to the remainder portion of the fish for chemical analysis. See Appendix A for photographs of typical operations. Consistent with the QAPP (TAI 2009), gut contents were archived.

2.3.3 Sample Locations

As noted within Section 2.2.4 of this report, FSCAs matched those targeted in 2005 (USEPA 2007), and were located within each of the following river reaches (Map 2-1):

- Reach 1 (U.S.-Canada border at RM 745 to RM 730)
- Reach 2 (RM 730 to RM 712)
- Reach 3 (RM 712 to RM 700)—Marcus Flats
- Reach 4 (RM 700 to RM 640)
- Reach 5 (RM 640 to RM 617)
- Reach 6 (RM 617 to Grand Coulee Dam near RM 596).

Locations where fish were successfully captured are shown on Maps 2-2 to 2-7. A summary of the total number of fish collected by size class and FSCA is presented in Table 2-4.

2.3.4 Analyte List and Methods

Planned target analytes as defined in the QAPP (TAI 2009) are presented in Table 2-2. Observations of condition and an external examination for health and abnormalities were recorded (Section 2.4) and photographs of each specimen (one on each side) were collected.

2.3.5 Collection Methods

The following is a summary of the methods used throughout the 2009 fish tissue sampling event. Generally, four to five people were assigned to each boat, including: the boat captain, field leader, one or two field technicians, and a guide from the Spokane Tribe or a representative from EPA or the Colville Tribe. Technical oversight by EPA and/or the Colville Tribe was provided throughout the duration of the sampling effort.

- **Gill nets.** Gill nets were constructed of monofilament mesh, with floats on the top horizontal line, and weights on the bottom line. The nets were 200 ft long and 10 ft high, with a mesh size of 3 to 4 cm. Ends were weighted with one or more concrete or lead anchors attached by a short line (about 1 m) to keep the net near but above the bottom. An inflated buoy was attached to each end to mark the locations of the net at the water surface (see Photographs A-1 and A-2 in Appendix A). Nets were generally deployed in the late afternoon or evening and retrieved the following morning. In some cases, nets were re-deployed in the morning, retrieved later that day or the following morning. A global positioning system (GPS) unit on board each vessel was used to document the location of each net set upon deployment. Nets were retrieved by pulling the anchor line up and gradually driving the boat forward while bringing in the remainder of the net. Fish and debris (e.g., vegetation) were removed as the net was pulled. Gill nets were successful in capturing medium and large fish species.
- **Boat electrofishing.** Electrofishing was conducted in littoral or shoreline areas following methods described by the Washington Department of Fish and Wildlife (WDFW) (Bonar et al. 2000). Settings were adjusted by the boat operator to fish effectively while limiting fish mortality. Electrofishing was most effective after dark; therefore, field crews usually launched vessels near sunset and electrofished until approximately midnight. Typically a crew of three was used for electrofishing efforts: one boat operator, and two netters. Long-handled nets allowed netters to reach stunned fish about 10 to 12 ft from the boat or under the water. Fishing depth was limited to approximately 10 ft of water. A GPS receiver was used to record the position at the beginning and end of each electrofishing transect. Electrofishing was successful in capturing all fish species and size

classes. An example of an electrofishing vessel is presented in Photograph A-3 in Appendix A.

- **Backpack electrofishing.** A backpack electrofisher was used as an alternative to boat electrofishing and to target small sized fish (≤ 15 cm). Backpack electrofishing was conducted using methods outlined by WDFW (Bonar et al. 2000). The operator used the backpack button switch to activate the anode in order to stun fish while wading instream. One or more assistants waded next to the operator using dip nets to capture stunned fish. Assistant(s) also adjusted electrofisher settings for the operator and monitored electrical output. Sampling was conducted while moving upstream. Backpack electrofishing generally occurred in the late afternoon and was successful at capturing small sized fish (≤ 15 cm).
- **Burbot traps.** Burbot traps were constructed of a conical steel frame wrapped in nylon netting, with an opening that allowed fish to enter but not escape. Traps were baited with fresh fish cut into pieces and placed in a mesh bag inside the trap⁴, and lowered to the bottom with a line attached to a surface buoy (see SOP #5 from the QAPP [TAI 2009]). The location and depth of each trap set was recorded on the fish collection form. Traps were deployed in a variety of locations at depths that ranged from approximately 20 to 100 ft, with limited success. Burbot trap deployment is depicted in Photograph A-4 in Appendix A.
- **Beach seines.** Beach seines were used near shorelines to collect small fish (≤ 15 cm). Beach seines were deployed from a boat (or by wading), where one end of the seine was fixed by a technician on the shore bank, and the other end secured on the boat (or by wading into the shallow area). The boat (or wader) was backed away from the shore while deploying the net, then the boat (or wader) moved back to the shore downstream or upstream of where the seine was secured. The seine was then manually pulled onto shore from both ends. Trapped fish congregated in the end of the looped net were dragged up onto shore and placed in buckets with water from that area so that target and non-target fish could be sorted. Photograph A-5 in Appendix A presents an example of this process.
- **Minnow traps.** Minnow traps were used as an alternative method targeting ≤ 15 cm fish. Traps consisted of two pieces clipped together to form a small cylinder slightly tapered at either end. Each end has a funnel entrance which leads into the center of the trap, allowing fish to enter but preventing them from escaping. Traps were generally placed on the substrate in the shallow shoreline

⁴ A mesh net bag prevented captured burbot from eating the bait fish. Visual inspection of bait bags after retrieval confirmed that bait fish were not consumed (i.e., bait bags were intact and contained the bait fish).

areas. A string of four to five traps along a line were set in the morning or afternoon and retrieved the next day.

- **Hoop nets.** Hoop nets were not identified in the QAPP (TAI 2009) as a primary method for fish collection. However, given the limited success in capturing burbot, guides from the Spokane Tribe suggested this as an alternative method. Two nets provided by the Spokane Tribe were tested in FSCA 6. A hoop net has a steel hoop supporting the nets round shape, and a smaller 12 inch steel hoop is woven into the center of the net (see Photograph A-6 in Appendix A). Bait is attached to the inner hoop. A rope bridle is attached in three spots around the outer hoop and connects to the main rope. A float was attached between the mainline and the bridle to support the bridle above the net. Hoop nets are anchored and buoyed in a similar fashion as gill nets. Hoop nets were set in the afternoon and collected the next day. Only two target fish (i.e., burbot) were collected using this method.

Following collection using the above-listed methods, fish were transferred to a live well on board the vessel. All fish were handled using nitrile gloves. Gloves were replaced between fish collection areas. Boat crews examined each fish to determine if it was within the target species and size class. Field crews had fish identification (ID) cards derived from Wydowski and Whitney (2003) to aid with species identification. Non-target fish were returned to the area they were collected. Target fish were given an ID number written on plastic tags, and attached to the fish with a nylon cable tie passed through the fish's mouth and out the gill opening under the operculum. Each fish was then placed in an individual resealable bag and placed in a cooler with ice. For the two smaller size classes, the ID tag was placed inside the resealable bag rather than affixed to the gills so as to reduce damage to the fish. Fish ID numbers were recorded on fish collection forms along with information about the time and location of collection. Coolers with target fish were returned to on-shore processing stations periodically throughout each day or evening.

2.3.6 Sampling Effort

To meet the DQOs a minimum sampling effort was planned for each FSCA and size class. Three to five days of sampling was conducted at each FSCA. A summary of the minimum required sampling effort per target fish size class is presented below.

≤15 cm Size Class

- Primary sampling gear and effort
 - Beach seines (8 hours or five seine hauls)
 - Electrofishing (3 hours of active electrofishing)

- Secondary sampling effort (if needed)
 - Beach seines (alternative gear equal effort, 8 hours or five seine hauls)
 - Boat/backpack electrofishing (3 hours of electrofishing).

>15 to ≤30 Size Class

- Primary sampling gear and effort
 - Gill nets (two 12-hour gill net sets with four gills nets per set)
 - Boat electrofishing (two 6-hour periods of active electrofishing)
- Secondary sampling effort (if needed)
 - Gill nets (two 12-hour gill net sets with three gills nets per set)
 - Boat electrofishing (two 6-hour periods of active electrofishing).

>30 cm Size Class

- Primary sampling gear and effort
 - Gill nets and electrofishing (same as 15 to 30 cm)
 - Burbot traps (two 12-hour sets with 12 traps per set)
- Secondary sampling effort (if needed)
 - Gill nets and electrofishing (same as 15 to 30 cm)
 - Burbot traps (two 12-hour sets with 12 traps per set).

2.3.7 Biological Measurements

Each fish was rinsed with a spray of site water, which was collected from the FSCA at the time of fish collection, to remove any ice, blood, or debris from the body surface. Next, species identification was verified using identification cards derived from Wydowski and Whitney (2003). Then the total length and weights were recorded (Appendix B), an external exam performed (Appendix C), and photographs taken (Appendix D and Photograph A-7 in Appendix A). Each fish tag number was recorded on the length-weight form, and the fish placed on a clean piece of aluminum foil, shiny side away from the fish. The field tag remained with each fish throughout onshore processing. The total length (i.e., anterior-most part of the fish to the tip of the compressed lobes of the caudal fin) of each fish was measured to the nearest millimeter. Each fish was weighed to the nearest gram using a laboratory balance (calibrated daily), and had been tared to the weight of the foil. External examinations were performed in accordance with the external exam sheet and guidelines presented in Smith et al. (2002).

Preferred aging structures by species are provided in Table 2-5. Fish were aged using their preferred structure, with the exception of kokanee where otoliths were examined (see field notebook in Appendix E). Fish of sizes ≤15 cm did not undergo the aging

process as it was assumed that they were generally within one year of age (see Appendix F, Modification 01). Based on recommendations from the WDFW, aging structures (i.e., otoliths, scales, or opercula) were removed from fish of the larger two size classes (see Table 2-5). Otoliths were removed by cutting into the skull of the fish with a disposable scalpel blade in accordance with techniques described by Secor et al. (1991) (see Photograph A-8 in Appendix A). Both otoliths were removed and placed into a slot in a plastic otolith storage tray, and each slot was logged into a logbook with the fish identification information. Fish scales were collected from each fish with a clean scalpel and placed in an envelope with the fish identification information written on the outside. Opercula were removed from both sides of fish (e.g., sucker species) using a clean scalpel or clean dissection scissors and placed in an envelope with the fish identification information written on the outside. Opercula were then placed in a freezer prior to shipping. Scales and otoliths were placed in a clean, cool dry area prior to shipping as it was not necessary to freeze them prior to shipping. All structures were sent to the WDFW laboratory in Olympia, Washington, for age determination.

2.4 FIELD SAMPLING RESULTS

The following section provides a discussion of fish sample collection results. A review of the field effort, fish collected, and fish characteristics (e.g., lengths/weights) are described below. Locations where fish were successfully captured are shown on Maps 2-2 through 2-7. A summary of the total number of fish collected by size class and FSCA is presented in Table 2-4. Field notebooks are in Appendix E, field collection forms are in Appendix G, and fish processing forms are in Appendix H.

2.4.1 Sampling Results for FSCA 1

2.4.1.1 Sampling Effort

Sampling effort conducted within FSCA 1 is summarized in Table 2-6 and successful fish collection locations are presented on Map 2-2. The minimum level of effort was met for all gear types, except for beach seines. However, when combining beach seines and minnow traps (an alternate method) the minimum level of effort was met (Table 2-6). The sampling effort is also summarized on a catch per unit effort (CPUE) basis in Tables 2-7a through 2-7f for each sampling method employed. Boat electrofishing and gill nets provided the highest CPUE of all the methods.

2.4.1.2 Fish Samples Collected

Information for each individual fish collected in FSCA 1 is documented in Table 2-8, while a summary of the total catch is described below for each size class and species:

≤15 cm Size Class

- Black crappie—one fish with a total length and weight of 56 mm and <1 g, respectively was collected
- Largescale sucker—13 fish ranging in length from 63 to 144 mm and in weight from 2 to 25 g were collected
- Longnose sucker—four fish ranging in length from 73 to 118 mm and in weight from 4 to 16 g were collected
- Pikeminnow—five fish ranging in length from 67 to 140 mm and in weight from 2.3 to 28 g were collected
- Rainbow trout—eight fish (all wild origin) ranging in length from 66 to 145 mm and in weight from 2.5 to 36.6 g were collected
- Redside shiner—one fish with a total length and weight of 100 mm and 8.2 g, respectively was collected
- Sculpin—20 fish ranging in length from 60 to 139 mm and in weight from 2 to 32 g were collected
- Smallmouth bass—14 fish ranging in length from 47 to 97 mm and in weight from 1.6 to 13 g were collected.

>15 cm to ≤30 cm Size Class

- Kokanee—15 fish (all hatchery origin) ranging in length from 265 to 300 mm and in weight from 200 to 321.3 g were collected
- Largescale sucker—one fish with a total length and weight of 197 mm and 82.4 g, respectively was collected
- Longnose sucker—three fish ranging in length from 154 to 167 mm and in weight from 37 to 40 g were collected
- Mountain whitefish—four fish ranging in length from 151 to 285 mm and in weight from 30 to 250.8 g were collected
- Rainbow trout—three fish (all wild origin) ranging in length from 180 to 300 mm and in weight from 65 to 299 g were collected
- Smallmouth bass—two fish ranging in length from 244 to 278 mm and in weight from 244.6 to 333 g were collected
- Walleye—one fish with a total length and weight of 157 mm and 31.2 g, respectively was collected
- Yellow perch—two fish ranging in length from 164 to 169 mm and in weight from 62 to 66 g were collected.

>30 cm Size Class

- Burbot—one fish with a total length and weight of 555 mm and 645 g, respectively was collected
- Kokanee—50 fish (4 wild, 46 hatchery) ranging in length from 302 to 485 mm and in weight from 273.8 to 1213.9 g were collected
- Largescale sucker—three fish ranging in length from 493 to 577 mm and in weight from 1157.8 to 1717.2 g were collected
- Longnose sucker—one fish with a total length and weight of 360 mm and 651 g, respectively was collected
- Mountain whitefish—three fish ranging in length from 424 to 477 mm and in weight from 926.8 to 1398.9 g were collected
- Rainbow trout—36 fish (all wild origin) ranging in length from 308 to 565 mm and in weight from 312.4 to 2613.8 g were collected
- Walleye—24 fish ranging in length from 319 to 674 mm and in weight from 260.2 to 3908 g were collected.

One juvenile white sturgeon was encountered and released in FSCA 1 (Map 2-8). A summary of all incidentally captured juvenile white sturgeon is presented in Table 2-9, with locations illustrated on Maps 2-8 through 2-10. All incidentally captured juvenile white sturgeon were handled per the WDFW protocols outlined in Permit #09-027A.

External examinations were performed to evaluate characteristics identified in Table 2-10. Table 2-11 provides a summary of all external abnormalities identified for each fish examined in FSCA 1. Information for each individual fish is provided in Appendix C. Few abnormalities were noted, with the exception of marks or cuts due to gill nets.

2.4.2 Sampling Results for FSCA 2

2.4.2.1 Sampling Effort

Sampling effort conducted within FSCA 2 is summarized Table 2-6 and successful fish collection locations presented on Map 2-3. The minimum level of effort was met for all gear types, except for boat electrofishing where one of the electrofishing vessels required repairs and was not able to fish one evening during week 1. Other collection methods employed were well above the minimum level of effort to make up for the electrofishing time missed. Sampling efforts are summarized on a CPUE basis in Tables 2-7a through 2-7f. Boat electrofishing and beach seines provided the highest CPUE of all the methods.

2.4.2.2 Fish Samples Collected

Information for individual fish collected in FSCA 2 is presented in Table 2-12, while a summary of the total catch is described below:

≤15 cm Size Class

- Bluegill—15 fish ranging in length from 26 to 38 mm and in weight from 0.3 to 1 g were collected
- Largescale sucker—26 fish ranging in length from 43 to 136 mm and in weight from 0.8 to 21 g were collected
- Longnose sucker—17 fish ranging in length from 40 to 132 mm and in weight from 0.6 to 23 g were collected
- Pikeminnow—19 fish ranging in length from 68 to 150 mm and in weight from 3 to 30 g were collected
- Rainbow trout—six fish (all wild origin) ranging in length from 12 to 146 mm and in weight from 5.7 to 31.8 g were collected
- Redside shiner—one fish with a total length and weight of 79 mm and 4 g, respectively was collected
- Sculpin—nine fish ranging in length from 72 to 109 mm and in weight from 3.2 to 18 g were collected
- Smallmouth bass—31 fish ranging in length from 43 to 91 mm and in weight from 0.1 to 12 g were collected
- Yellow perch—17 fish ranging in length from 60 to 142 mm and in weight from 1 to 36 g were collected.

>15 cm to ≤30 cm Size Class

- Kokanee—10 fish (all hatchery origin) ranging in length from 263 to 296 mm and in weight from 234 to 336 g were collected
- Largescale sucker—five fish ranging in length from 208 to 275 mm and in weight from 77 to 260 g were collected
- Longnose sucker—10 fish ranging in length from 158 to 280 mm and in weight from 38.4 to 217.5 g were collected
- Mountain whitefish—one fish with a total length and weight of 237 mm and 109 g, respectively was collected
- Pikeminnow—14 fish ranging in length from 155 to 280 mm and in weight from 29.1 to 212.6 g were collected

- Rainbow trout—nine fish (all wild origin) ranging in length from 170 to 258 mm and in weight from 45 to 178 g were collected
- Smallmouth bass—one fish with a total length and weight of 279 mm and 360 g, respectively was collected.

>30 cm Size Class

- Burbot—three fish ranging in length from 479 to 623 mm and in weight from 609 to 1366 g were collected
- Kokanee—29 fish (1 wild, 28 hatchery) ranging in length from 304 to 485 mm and in weight from 316 to 1207g were collected
- Largescale sucker—12 fish ranging in length from 332 to 583 mm and in weight from 439 to 2135 g were collected
- Longnose sucker—six fish ranging in length from 306 to 408 mm and in weight from 304.3 to 770 g were collected
- Mountain whitefish—four fish ranging in length from 444 to 480 mm and in weight from 884 to 1226 g were collected
- Rainbow trout—33 fish (30 wild, 3 hatchery) ranging in length from 313 to 572 mm and in weight from 364 to 1806 g were collected
- Smallmouth bass—one fish with a total length and weight of 414 mm and 1147 g, respectively was collected
- Walleye—43 fish ranging in length from 316 to 582 mm and in weight from 268 to 1899 g were collected.

Fifty-nine juvenile white sturgeon were captured in FSCA 2 (Map 2-9). Of those, 55 were released in good condition and four were incidental mortalities. These mortalities were kept on ice and delivered to the WDFW Sherman Creek Hatchery as directed by Jason McLellan of WDFW⁵. A summary of all juvenile white sturgeon incidentally captured is presented in Table 2-9 and locations are presented on Maps 2-8 through 2-10.

External examinations were performed to evaluate the characteristics identified in Table 2-10. Table 2-11 provides a summary of all external abnormalities identified for each fish. Information for each individual fish is provided in Appendix C. Few abnormalities were noted, with the exception of marks or cuts, and frayed fins likely due to gill nets.

⁵ It is uncertain what, if anything was done (e.g., chemical analyses) with incidental juvenile white sturgeon mortalities provided to the WDFW consistent with Permit #09-027A. Any analyses that may have been performed by WDFW are not part of this sampling effort and have not been communicated or made available to TAI, if they exist.

2.4.3 Sampling Results for FSCA 3

2.4.3.1 Sampling Effort

Sampling effort conducted within FSCA 3 is summarized Table 2-6 and successful fish collection locations are presented on Map 2-4. The minimum level of effort was met for all gear types, except for beach seines. Beach seines targeted the two smaller size classes, and enough fish were collected in FSCA 3 to complete six composites for each size class, thus only four seine hauls were conducted. Sampling effort on a CPUE basis is summarized in Tables 2-7a through 2-7f. Boat electrofishing and gill nets provided the highest CPUE of all methods.

2.4.3.2 Fish Samples Collected

Information for individual fish collected in FSCA 3 is documented in Table 2-13, while a summary of the total catch is described below for each size class and species:

≤15 cm Size Class

- Black crappie—29 fish ranging in length from 60 to 107 mm and in weight from 2 to 16.8 g were collected
- Largescale sucker—seven fish ranging in length from 68 to 149 mm and in weight from 2.1 to 29.5 g were collected
- Longnose sucker—39 fish ranging in length from 62 to 112 mm and in weight from 1.3 to 12.2 g were collected
- Pikeminnow—45 fish ranging in length from 70 to 150 mm and in weight from 3 to 27.4 g were collected
- Rainbow trout—11 fish (all wild origin) ranging in length from 12 to 138 mm and in weight from 7 to 26.4 g were collected
- Sculpin—12 fish ranging in length from 40 to 138 mm and in weight from 0.4 to 32 g were collected
- Smallmouth bass—70 fish ranging in length from 50 to 149 mm and in weight from 1.7 to 45 g were collected
- Walleye—seven fish ranging in length from 102 to 149 mm and in weight from 7.4 to 24.2 g were collected
- Yellow perch—33 fish ranging in length from 44 to 109 mm and in weight from 0.6 to 15.9 g were collected.

>15 cm to ≤30 cm Size Class

- Kokanee—16 fish (all hatchery origin) ranging in length from 218 to 299 mm and in weight from 181.9 to 336 g were collected
- Largescale sucker—17 fish ranging in length from 153 to 275 mm and in weight from 29 to 237.1 g were collected
- Longnose sucker—19 fish ranging in length from 152 to 230 mm and in weight from 33.9 to 120 g were collected
- Pikeminnow—38 fish ranging in length from 152 to 296 mm and in weight from 20.6 to 237 g were collected
- Rainbow trout—three fish (all wild origin) ranging in length from 155 to 280 mm and in weight from 34.6 to 228 g were collected
- Smallmouth bass—25 fish ranging in length from 161 to 300 mm and in weight from 56.8 to 441 g were collected
- Walleye—12 fish ranging in length from 157 to 276 mm and in weight from 29 to 166 g were collected.

>30 cm Size Class

- Burbot—14 fish ranging in length from 436 to 600 mm and in weight from 493 to 1085 g were collected
- Kokanee—49 fish (1 wild, 48 hatchery) ranging in length from 301 to 392 mm and in weight from 312 to 691 g were collected
- Lake whitefish—31 fish ranging in length from 342 to 607 mm and in weight from 457 to 2445 g were collected
- Largescale sucker—25 fish ranging in length from 341 to 594 mm and in weight from 461 to 2116 g were collected
- Rainbow trout—33 fish (19 wild, 14 hatchery) ranging in length from 301 to 564 mm and in weight from 321 to 2121 g were collected
- Smallmouth bass—eight fish ranging in length from 305 to 390 mm and in weight from 377 to 1018 g were collected
- Walleye—47 fish ranging in length from 342 to 621 mm and in weight from 374 to 1976 g were collected.

Five juvenile white sturgeon were incidentally captured in FSCA 3 (Map 2-10). Of those, four were released in good condition and one was an incidental mortality. This mortality was kept on ice and delivered to the WDFW Sherman Creek Hatchery as directed by Jason McLellan, WDFW. A summary table of all juvenile white sturgeon incidentally captured is presented in Table 2-9 and locations are presented on Maps 2-8 through 2-10.

During fishing activities it was noted by the field team that crayfish were frequently encountered in burbot traps. All crayfish were released in the area they were collected.

External examinations were performed to evaluate characteristics identified in Table 2-10. Table 2-11 provides a summary of all external abnormalities identified for fish in FSCA 3. Information for each individual fish is provided in Appendix C. Few abnormalities were noted, with the exception of marks or cuts or frayed fins likely due to the gill nets.

2.4.4 Sampling Results for FSCA 4

2.4.4.1 Sampling Effort

Sampling effort conducted within FSCA 4 is summarized Table 2-6 and successful fish collection locations are presented in Map 2-5. The minimum level of effort was met or exceeded for all gear types. Sampling effort on a CPUE basis is summarized in Tables 2-7a through 2-7f. Boat electrofishing and gill nets provided the highest CPUE.

2.4.4.2 Fish Samples Collected

Information for each individual fish collected in FSCA 4 is documented in Table 2-14, while a summary of the total catch is described below for each size class and species.

≤15 cm Size Class

- Largescale sucker—one fish with a total length and weight of 114 mm and 12.5 g, respectively was collected
- Longnose sucker—15 fish ranging in length from 81 to 110 mm and in weight from 4.6 to 85 g were collected
- Pikeminnow—one fish with a total length and weight of 100 mm and 7.3 g, respectively was collected
- Sculpin—five fish ranging in length from 50 to 82 mm and in weight from 1.2 to 6.1 g were collected
- Smallmouth bass—54 fish ranging in length from 53 to 93 mm and in weight from 1.6 to 10.9 g were collected
- Walleye—31 fish ranging in length from 83 to 150 mm and in weight from 4.2 to 25.8 g were collected
- Yellow perch—44 fish ranging in length from 63 to 110 mm and in weight from 2.2 to 44 g were collected.

>15 cm to ≤30 cm Size Class

- Kokanee—11 fish (all hatchery origin) ranging in length from 279 to 300 mm and in weight from 205 to 347 g were collected
- Lake whitefish—two fish ranging in length from 210 to 260 mm and in weight from 94 to 171 g were collected
- Largescale sucker—four fish ranging in length from 200 to 212 mm and in weight from 89 to 111 g were collected
- Longnose sucker—one fish with a total length and weight of 200 mm and 88.7 g, respectively was collected
- Peamouth—four fish ranging in length from 264 to 285 mm and in weight from 166 to 213 g were collected
- Pikeminnow—one fish with a total length and weight of 277 mm and 177 g, respectively was collected
- Rainbow trout—four fish (all wild origin) ranging in length from 161 to 299 mm and in weight from 44.6 to 360 g were collected
- Smallmouth bass—seven fish ranging in length from 162 to 279 mm and in weight from 62.9 to 381 g were collected
- Walleye—26 fish ranging in length from 151 to 288 mm and in weight from 26.2 to 202 g were collected
- Yellow perch—two fish ranging in length from 197 to 242 mm and in weight from 89 to 186 g were collected.

>30 cm Size Class

- Burbot—35 fish ranging in length from 420 to 620 mm and in weight from 393 to 1194 g were collected
- Kokanee—32 fish (2 wild, 30 hatchery) ranging in length from 302 to 418 mm and in weight from 298 to 924 g were collected
- Lake whitefish—33 fish ranging in length from 375 to 580 mm and in weight from 693 to 2528 g were collected
- Largescale sucker—nine fish ranging in length from 430 to 622 mm and in weight from 1044 to 2134 g were collected
- Longnose sucker—11 fish ranging in length from 384 to 450 mm and in weight from 795 to 1298 g were collected
- Rainbow trout—38 fish (11 wild, 27 hatchery) ranging in length from 301 to 545 mm and in weight from 366 to 1852 g were collected

- Smallmouth bass—two fish ranging in length from 305 to 319 mm and in weight from 371 to 560 g were collected
- Walleye—37 fish ranging in length from 302 to 592 mm and in weight from 232 to 2310 g were collected.

No juvenile white sturgeon was encountered in FSCA 4. During fishing activities in FSCA 4, it was noted by the field team that that crayfish were frequently encountered in burbot traps. All crayfish were released in the areas they were collected.

External examinations were performed to evaluate characteristics identified in Table 2-10. Table 2-11 provides a summary of all external abnormalities identified for each fish examined for FSCA 4. Information for each individual fish is provided in Appendix C. Few abnormalities were noted, with the exception of marks or cuts and frayed fins, likely due to the gill nets.

2.4.5 Sampling Results for FSCA 5

2.4.5.1 Sampling Effort

Sampling effort conducted within FSCA 5 is summarized Table 2-6 and successful fish collection locations presented in Map 2-6. The minimum level of effort was met (or exceeded) for all gear types, except beach seines. Four of five targeted beach seine hauls were conducted. The CPUE is described in Tables 2-7a through 2-7f. Beach seines did not result in any fish collected in FSCA 5 (Table 2-7d). Boat electrofishing provided the highest CPUE.

2.4.5.2 Fish Samples Collected

Information for each individual fish collected in FSCA 5 is documented in Table 2-15, while a summary of the total catch is described below for each size class and species.

≤15 cm Size Class

- Black crappie—one fish with a total length and weight of 115 mm and 19.8 g, respectively was collected
- Sculpin—23 fish ranging in length from 63 to 100 mm and in weight from 2.8 to 12.6 g were collected
- Smallmouth bass—65 fish ranging in length from 8.5 to 149 mm and in weight from 2.6 to 44.9 g were collected
- Walleye—33 fish ranging in length from 80 to 150 mm and in weight from 3.5 to 30 g were collected
- Yellow perch—40 fish ranging in length from 66 to 126 mm and in weight from 3 to 22.7 g were collected.

>15 cm to ≤30 cm Size Class

- Kokanee—13 fish (all hatchery origin) ranging in length from 245 to 300 mm and in weight from 143 to 331 g were collected
- Largescale sucker—one fish with a total length and weight of 295 mm and 328 g, respectively was collected
- Longnose sucker—two fish ranging in length from 260 to 264 mm and in weight from 206 to 277 g were collected
- Pikeminnow—one fish with a total length and weight of 240 mm and 121 g, respectively was collected
- Smallmouth bass—16 fish ranging in length from 152 to 281 mm and in weight from 46 to 291 g were collected
- Walleye—18 fish ranging in length from 160 to 226 mm and in weight from 30 to 104 g were collected
- Yellow perch—two fish ranging in length from 198 to 264 mm and in weight from 102.4 to 272 g were collected.

>30 cm Size Class

- Burbot—34 fish ranging in length from 440 to 624 mm and in weight from 448 to 1172 g were collected
- Kokanee—30 fish (all hatchery origin) ranging in length from 302 to 360 mm and in weight from 311 to 542 g were collected
- Lake whitefish—21 fish ranging in length from 344 to 536 mm and in weight from 521 to 1806 g were collected
- Largescale sucker—four fish ranging in length from 500 to 623 mm and in weight from 1122 to 2529 g were collected
- Rainbow trout—34 fish (6 wild, 28 hatchery) ranging in length from 301 to 496 mm and in weight from 316 to 1414 g were collected
- Smallmouth bass—13 fish ranging in length from 301 to 332 mm and in weight from 300 to 505 g were collected
- Walleye—32 fish ranging in length from 312 to 900 mm and in weight from 234 to 6500 g were collected.

No juvenile white sturgeon was encountered in FSCA 5.

External examinations were performed to evaluate characteristics identified in Table 2-10. Table 2-11 provides a summary of all external abnormalities identified for each fish examined for FSCA 5. Information for each individual fish is provided in Appendix C.

Few abnormalities were noted, with the exception of frayed fins and marks or cuts likely due to the gill nets.

2.4.6 Sampling Results for FSCA 6

2.4.6.1 Sampling Effort

Sampling effort conducted within FSCA 6 is summarized Table 2-6 and successful fish collection locations presented in Map 2-7. The minimum level of effort was met (or exceeded) for all gear types, except beach seines. Four of five targeted beach seine hauls were conducted. The CPUE is described in Tables 2-7a through 2-7f. Boat electrofishing and gill nets provided the highest CPUE of all the methods.

2.4.6.2 Fish Samples Collected

Information for each individual fish collected in FSCA 6 is documented in Table 2-16, while a summary of the total catch is described below for each size class and species:

≤15 cm Size Class

- Black crappie—one fish with a total length and weight of 99 mm and 13 g, respectively was collected
- Bluegill—seven fish ranging in length from 40 to 50 mm and in weight from 0.9 to 1.9 g were collected
- Sculpin—six fish ranging in length from 40 to 94 mm and in weight from 0.6 to 8 g were collected
- Smallmouth bass—82 fish ranging in length from 8.1 to 149 mm and in weight from 3 to 42.1 g were collected
- Walleye—nine fish ranging in length from 105 to 149 mm and in weight from 8.4 to 24.7 g were collected
- Yellow perch—39 fish ranging in length from 81 to 120 mm and in weight from 5.1 to 107 g were collected.

>15 cm to ≤30 cm Size Class

- Kokanee—15 fish (all hatchery origin) ranging in length from 245 to 300 mm and in weight from 151 to 349 g were collected
- Smallmouth bass—22 fish ranging in length from 151 to 278 mm and in weight from 37.5 to 322 g were collected
- Walleye—19 fish ranging in length from 151 to 280 mm and in weight from 23.8 to 159.4 g were collected.

>30 cm Size Class

- Burbot—27 fish ranging in length from 424 to 570 mm and in weight from 381 to 1202 g were collected
- Kokanee—27 fish (all hatchery origin) ranging in length from 301 to 356 mm and in weight from 329 to 501 g were collected
- Largescale sucker—30 fish ranging in length from 475 to 615 mm and in weight from 1211 to 2478 g were collected
- Rainbow trout—40 fish (18 wild, 22 hatchery) ranging in length from 310 to 519 mm and in weight from 348 to 1440 g were collected
- Smallmouth bass—50 fish ranging in length from 303 to 450 mm and in weight from 296 to 1486 g were collected
- Walleye—34 fish ranging in length from 332 to 545 mm and in weight from 278 to 1348 g were collected.

No juvenile white sturgeon was encountered in FSCA 6.

External examinations were performed to evaluate characteristics identified in Table 2-10. Table 2-11 provides a summary of all external abnormalities identified for each fish examined for FSCA 6. Information for each individual fish is provided in Appendix C. Few abnormalities were noted, with the exception of frayed fins and marks or cuts likely due to the gill nets.

2.5 SAMPLE COMPOSITING

Composite determination was conducted after field sampling was completed and all samples were stored at the analytical laboratory (i.e., Columbia Analytical Services [CAS]). The following methods were used to randomly assign individual samples (i.e., whole body, fillet, or remainder) from a FSCA into composite samples by species.

- **≤15 cm size class.** Composites were formed for individual species with a minimum of five fish. The QAPP (TAI 2009) specified that composites would be formed such that the smallest individual is not less than 75 percent of the length of the largest individual. However, due to the analytical mass required (~100 to 300 g, depending on the analytical suite) it was not possible to follow this rule and have a sample with sufficient mass to conduct the analysis. Therefore for this size class, all individuals collected for a species for each FSCA were included in the composite or randomly assigned to a composite until sufficient mass was achieved.
- **>15 to ≤30 cm size class.** Composites were formed for individual species with a minimum of three fish. Fish were assigned to a composite using a random number generator (i.e., each fish had an equal chance to be included in the

composite). Fish assigned to each composite sample were checked to ensure that the smallest individual was not less than 75 percent of the largest individual, in accordance with the QAPP (TAI 2009). If a fish was outside this range, than another randomly selected fish was placed in the composite. All fish not assigned to a composite were archived.

- **>30 cm size class.** Composites were formed for individual species with a minimum of three fish. In some cases, the target of 30 fish for 6 composites was not reached, and therefore some composites were formed with three, four, or five fish depending on the number caught. Fish were assigned to a composite using a random number generator (i.e., each fish had an equal chance to be included in the composite). No size restrictions were proposed in the QAPP (TAI 2009), therefore no alterations of the composites were necessary based on total length. All fish not assigned to a composite were archived. In addition to compositing as described above, fillets for walleye and smallmouth bass were individually analyzed for total mercury per the QAPP (TAI 2009). Walleye and smallmouth bass captured in excess of the targeted number were also analyzed for total mercury in the fillets.

Details on the sampling event, fish collected, and composites formed are described below. Table 2-17 summarizes the final compositing scheme, including number of composites and the number of fish in each composite (note that individual fish are denoted as a composite containing one fish). This compositing scheme was reviewed and approved by EPA prior to chemical analysis.

2.5.1 FSCA 1

Individual fish from FSCA 1 were assigned to composite samples and approved by EPA as shown in Table 2-17. Individual fish from FSCA 1 assigned to each composite are shown in Table 2-8. Based on the fish collected, a total of six and four composites were made of the smaller two size classes, respectively. For the >30 cm size class, five composites were formed for walleye, three for largescale and longnose suckers, one for burbot, three for mountain whitefish, six for rainbow trout, and six for kokanee (Table 2-18).

2.5.2 FSCA 2

Individual fish from FSCA 2 were assigned to composite samples and approved by EPA as shown in Table 2-17. Individual fish from FSCA 2 assigned to each composite are shown in Table 2-12. Based on the fish collected, a total of seven and five composites were made of the smaller two size classes, respectively. For the >30 cm size class, six composites were formed for walleye, three for burbot, 11 for largescale and longnose suckers, four for mountain whitefish, six for rainbow trout, one for smallmouth bass and six for kokanee (Table 2-18).

2.5.3 FSCA 3

Individual fish from FSCA 3 were assigned to composite samples and approved by EPA as shown in Table 2-17. Individual fish from FSCA 3 assigned to each composite are shown in Table 2-13. Based on the fish collected, a total of eight composites were made for each of the two smaller size classes. For the >30 cm size class, six composites were formed for walleye, nine for smallmouth bass, five for burbot, five for largescale and longnose suckers, six for lake whitefish, six for rainbow trout, and six for kokanee (Table 2-18).

2.5.4 FSCA 4

Individual fish from FSCA 4 were assigned to composite samples and approved by EPA as shown in Table 2-17. Individual fish from FSCA 4 assigned to each composite are shown in Table 2-14. Based on the fish collected, a total of five composites were made for each of the two smaller size classes. For the >30 cm size class, six composites were formed for walleye, six for burbot, 14 for largescale and longnose suckers, six for lake whitefish, six for rainbow trout, two for smallmouth bass, and six for kokanee (Table 2-18).

2.5.5 FSCA 5

Individual fish from FSCA 5 were assigned to composite samples and approved by EPA as shown in Table 2-17. Individual fish from FSCA 5 assigned to each composite are shown in Table 2-15. Based on the fish collected, a total of four and five composites were made of the smaller two size classes, respectively. For the >30 cm size class, six composites were formed for walleye, three for smallmouth bass, six for burbot, four for largescale and longnose suckers, four for lake whitefish, six for rainbow trout, and six for kokanee (Table 2-18).

2.5.6 FSCA 6

Individual fish from FSCA 6 were assigned to composite samples and approved by EPA as shown in Table 2-17. Individual fish from FSCA 6 assigned to each composite are shown in Table 2-16. Based on the fish collected, a total of four and five composites were made of the smaller two size classes, respectively. For the >30 cm size class, six composites were formed for walleye, nine for smallmouth bass, five for burbot, six for largescale and longnose suckers, six for rainbow trout, and five for kokanee (Table 2-18).

2.6 AGE MEASUREMENTS

All aging structures (i.e., otoliths, scales, or opercula) of fish >15 cm were sent to the WDFW laboratory in Olympia, Washington, for age determination. Results of the aging analysis are presented by species and respective size class in Figure 2-1 a through j.

Burbot ranged in age from 2 to 11 years. Kokanee were ≤ 2 years of age. Pikeminnow ranged in age from 1 to 6 years of age. Few yellow perch samples were collected and those ranged from less than 1 year to 3 years old. Only results from FSCA 1 are available for sculpin and those fish ranged from 1 to 6 years. Smallmouth bass ranged in age from less than 1 to 8 years. Some of the oldest fish caught were largescale and longnose suckers, which ranged in age from 1 to 34 years. Rainbow trout ranged in age from less than 1 year to 6 years. Walleye and whitefish ranged in age from less than 1 year to 12 years.

3 QUALITY ASSURANCE PROJECT PLAN MODIFICATIONS AND DEVIATIONS

This section provides a discussion of modifications to QAPP methods and deviations from the QAPP and field sampling plan (FSP), and how these changes affect the quality of data.

3.1 GENERAL MODIFICATIONS TO QAPP METHODS

Three modifications to the QAPP were enacted during the 2009 fish tissue program. Copies of the field modifications are presented in Appendix F and summarized below.

- **Modification 01.** During the first few days of sampling it was identified that collecting aging structures of ≤ 15 cm fish slowed on-shore processing activities. It was assumed that ≤ 15 cm fish are generally young of the year and that this data point was not critical for the fish tissue program. Therefore, aging structures were not collected from ≤ 15 cm fish collected after October 1, 2009.
- **Modification 02.** The QAPP (TAI 2009) indicated that fish captured dead from gill nets should not be used for the sampling program. A modification was made in order to utilize all available target fish that were captured. Therefore, if a captured fish was dead, did not show signs of deterioration as observed immediately upon retrieval and during onshore processing activities, then the fish was to be considered a valid sample, if subsequent sampling efforts did not satisfy anticipated (i.e., design) capture rates. Fish that were dead upon sample retrieval are identified in Appendix B.
- **Modification 03.** As written in the QAPP (TAI 2009), stainless steel tweezers or forceps were to be replaced between FSCAs when handling fish. Although the QAPP was followed as written, it was recommended by Greg White (CH2M Hill) that tweezers/forceps be replaced between each fish species within each FSCA. This step was added to the sampling process.

In addition to the above-mentioned, fish >30 cm were not being scaled prior to filleting as per the QAPP (TAI 2009). However, these methods were determined by EPA's field oversight team to pose a potential problem with the usability of samples for the HHRA. Therefore, per EPA's direction and request, large fish were scaled. A field change form was not prepared, although verbal authorization was provided by Helen Bottcher (October 1, 2009).

None of the modifications identified above are anticipated to adversely affect the quality of the data collected under the 2009 fish tissue program.

3.2 DEVIATIONS FROM QAPP AND FSP

Deviations from the QAPP and FSP occurred and are summarized below for each FSCA, including target species completeness, species identification, number of fish per composite, sample locations, and holding times. Species identifications of a subset of small (≤ 15 cm) and medium (≥ 15 cm to ≤ 30 cm) sized fish were reviewed by Greg White, a fisheries biologist with CH2M Hill, at CAS in Kelso, WA on March 16-17, 2010. A total of 10 percent of individuals in the ≤ 15 cm size class were randomly selected from the catostomid, centrarchid, and cyprinid fish families. In addition, 10 percent of individuals in the >15 to ≤ 30 cm size class (sucker species only) were checked for identification accuracy; by random selection, these were all from FSCA 3. Mr. White's report is included in Appendix I, and summarized below.

The QAPP (TAI 2009) was inconsistent regarding arsenic speciation. In one instance it stated that "Arsenic speciation will be conducted to evaluate inorganic arsenic (As^{+3} and As^{+5}) and organic arsenic (monomethylarsonate [MMA] and dimethylarsinate [DMA]) species"; while in the tables and FSP portion of the QAPP (TAI 2009) it only identified the evaluation of total inorganic and total arsenic, which is what was completed by the laboratories. This was accomplished by measuring total arsenic and total inorganic arsenic only. Total inorganic arsenic was not detected in any of the samples analyzed and therefore MMA and DMA were identified but not quantified. Using the full detection limit value this meant that total inorganic arsenic was no more than 0.3 to 1 percent of the total arsenic. Therefore, and in consultation with EPA (personal communication, July 2011), it was decided that organic arsenic species could reasonably be assumed to be 99 percent of the total amount of arsenic measured and therefore, it was not necessary to directly measure MMA or DMA.

3.2.1 Identification Codes

Sample identifiers were reviewed for accuracy and comparability to what was specified in Appendix A of the QAPP (TAI 2009) and the database. Identifiers for each individual fish deviated from the QAPP; whereas identifiers for composites adhered to the QAPP more closely. A key to sample identification codes are provided in Table 3-1.

Sample Identifiers. The QAPP specified starting each sample/composite identifier with "TC" for "Teck Code," which was not completed. Rather sample identifiers began with a number from 1 to 6, indicating the FSCA, as required by the QAPP (TAI 2009). Sample identifiers for individual fish then had a code for the method of collection (e.g., EB = electrofishing from a boat; GN = gill netting), followed by a four digit number added sequentially for each fish upon capture. For large fish, following filleting procedures the remainder was identified as either "offal" or "remainder," and was designated as a "-O" or "-R", respectively; fillets were identified with a "-F."

Composite Identifiers. The identifier for composites also started with the FSCA number which was then followed by fish species code. The fish species code was correctly assigned, except for smallmouth bass (identified as “SMB” instead of “SB”) and sculpin (identified as “SC” instead of “SN”). An “H” for “hatchery” and “W” for “wild” were added to rainbow trout per the QAPP, while only the “H” was added to the kokanee code; those without the “H” are wild fish. The size class code (S1 to S3) was carried forward as a number, and the required “S” was inadvertently dropped. An individual composite number (4 digits) was then assigned. If a composite was comprised of fillets, then the identifier ended with “-F;” remainders were identified with “-R.” Some whole fish and fillets were analyzed individually without being composited, and their composite identifiers had “IND” included after the species code.

Database Retrievals. In the Project Database, the column labeled “sample_no” will be either the individual fish number or the composite number. When field data are retrieved (including age, length, and weight), information is provided for individual fish only. When laboratory analytical data are retrieved (i.e., chemical concentrations), information is provided for composites only, with the exception of those fish (or fillets) that were analyzed as individuals. Therefore, the “sample_no” column will contain either the individual sample identifier (field data), or the composite identifier plus individual identifiers (laboratory data). This column also identifies whether a result is a laboratory or field duplicate (“dup”) or triplicate (“trip”).

None of the deviations discussed in this section are expected to adversely affect the quality of the data collected under the 2009 fish tissue program.

3.2.2 FSCA 1

The following deviations from the QAPP for FSCA 1 are noted:

- **Target species.** A goal of two species within three feeding guilds for ≤ 15 cm fish was targeted. However, the minimum level of effort resulted in obtaining five of the six desired species. Thus, only one species within the omnivore feeding guild was collected. A similar goal was targeted for the >15 to ≤ 30 cm size class, while only three of the six species were collected. Rainbow trout in this size range were found to be abundant and were substituted as one of the target species. However, no species within the piscivore feeding guild were collected. For the largest size class (>30 cm), targets were not met for burbot (only one fish collected), walleye (five of six composites), largescale and longnose suckers (three of six composites), whitefish (three of six composites), and smallmouth bass (zero of six composites). Although the minimum level of effort was met (and exceeded for some methods) not all of the target fish were collected. A number of factors may have contributed to these reduced numbers (e.g., available habitat, weather, water levels, and/or migration to tributaries).

- **Species identification.** In the <15 cm size class, 26 fish were randomly chosen for a review of their species identification. One longnose sucker was misidentified as a largescale sucker, and vice versa. One redbside shiner was misidentified as a northern pikeminnow. All other fish (13 smallmouth bass, three northern pikeminnow, three longnose suckers, three largescale suckers, and one black crappie) were correctly identified.
- **Composite numbers.** A minimum of five individual fish per composite was the goal as specified in the QAPP (TAI 2009). However, due to the relatively low catch totals for some species within the >15 to ≤30 cm and >30 cm size classes, it was necessary to develop composites with three to five individual fish in order to form composite samples to meet the overall goals of the QAPP. The number of fish in each composite is shown in Table 2-17.
- **Sample locations.** In general, sample locations were within FSCA boundaries. In accordance with the QAPP Section A.9.4.2, "The approach to be used for the 2009 fish tissue study is to collect fish from the same six FSCAs used by EPA in 2005 (USEPA 2007). However, if target fish species are not found within the FSCA in a particular reach, then the length of the FSCA may be extended to collect the target number of fish." In FSCA 1, three sample locations (see Map 2-2) occurred outside FSCA boundaries. Specifically, a gill net was placed just above the northern boundary. The current in this stretch of the river was swift, thus the gill net was placed in an area where the buoys would remain visible. During the first few days of sampling in FSCA 1 there was poor success for ≤15 cm fish. Therefore on the last day of sampling (October 1, 2009), an additional attempt was made (i.e., beach seines and backpack electrofishing) to capture this size class just north of the FSCA 1 boundary. Several <15 cm fish were captured areas a result of this additional effort (see Map 2-2).
- **Holding times.** According to the QAPP (TAI 2009), fish were to be held on ice and processed within 48 hours of collection from each FSCA. During week 1, some fish were processed within 60 hours (i.e., one evening later). No deterioration was noted upon processing, therefore the samples were considered acceptable. When available, only fish processed within the 48 hour period were included in respective composites. Fish exceeding holding times are noted in Table 2-8. Composite numbers 1MW3001, 1RBW2001, 1RBW3005, 1RBW3006, 1WE3003, 1WE3004, and 1WE3005 include at least one fish processed over the holding time.

3.2.3 FSCA 2

The following deviations from the QAPP for FSCA 2 are noted:

- **Target species.** A goal of two species within each of three different feeding guilds for the >15 to ≤30 cm size class was targeted (i.e., total of six different species).

Five of the targeted six species were collected from FSCA 2. Rainbow trout in this size range were found to be abundant and were substituted as one of the target species. For the largest size class (>30 cm), targets were not met for smallmouth bass (one of six composites), burbot (three of six composites), and whitefish (four of six composites). Although the minimum level of effort was met (and exceeded for some methods) not all target fish were collected. A number of factors may have contributed to these reduced numbers (e.g., available habitat, weather, water levels, and/or migration to tributaries).

- **Species identification.** In the <15 cm size class, five fish were randomly chosen for a review of their species identification. One peamouth was misidentified as a northern pikeminnow. All other fish (four northern pikeminnow) were correctly identified.
- **Composite numbers.** A minimum of five individual fish per composite was the goal as specified in the 2009 Fish Tissue QAPP (TAI 2009). However, due to the relatively low catch totals for some species within the >15 to ≤30 cm and >30 cm size classes composites it was necessary to develop composites with three to five individual fish in order to form composite samples to meet the overall goals of the QAPP. The number of fish in each composite is shown in Table 2-17.
- **Holding times.** According to the QAPP (TAI 2009), fish were to be held on ice and processed within 48 hours of collection from each FSCA. During week 1 two fish from FSCA 2 were processed after the 48 hr period (i.e., within 60 hours, the next evening). No deterioration was noted upon processing, therefore the samples were considered acceptable. When available, only fish processed within the 48 hour period were proposed for inclusion in a composite. Fish exceeding the holding times are noted in Table 2-12. Only composite number 2KOH3005 included fish processed over the holding time.

3.2.4 FSCA 3

The following deviations from the QAPP for FSCA 3 are noted:

- **Target species.** For the largest size class (>30 cm), the targets were not met for burbot (five of six composites) and largescale and longnose suckers (five of six composites). Although the minimum level of effort was met (and exceeded for some methods) not all of the target fish were collected. A number of factors may have contributed to these deviations (e.g., available habitat, weather, water levels, and/or migration to tributaries).
- **Species identification.** In the ≤15 cm size class, 32 fish were randomly chosen for a review of their species identification. Three peamouth were misidentified as northern pikeminnow. One fish that was either a peamouth or speckled dace had been misidentified as a northern pikeminnow. All other fish (14 northern

pikeminnow, four longnose suckers, eight largescale suckers, and two black crappie) were correctly identified. Five medium sized (≥ 15 to ≤ 30 cm) fish were randomly chosen and reviewed for correct species identification. All five were largescale suckers and were correctly identified.

- **Composite numbers.** A minimum of five individual fish per composite was the goal as specified in the QAPP (TAI 2009). However, due to the relatively low catch totals for some species within the >15 to ≤ 30 cm and >30 cm size classes composites it was necessary to develop composites with three to five individual fish to meet the overall goals of the QAPP. The number of fish in each composite is shown in Table 2-17.

3.2.5 FSCA 4

The following deviations from the QAPP for FSCA 4 are noted:

- **Target species.** For the smallest size class (≤ 15 cm), only five of six targeted composites could be formed. There were no fish from the insectivore feeding guild captured in this reach of this size-class. For the largest size class (>30 cm), targets were not met for smallmouth bass (two of six composites). Although the minimum level of effort was met (and exceeded for some methods) not all target fish were collected. A number of factors may have contributed to these reduced numbers (e.g., available habitat, weather, water levels, and/or migration to tributaries).
- **Species identification.** In the ≤ 15 cm size class, three fish were randomly chosen for a review of their species identification. All three had been correctly identified as longnose suckers.
- **Composite numbers.** A minimum of five individual fish per composite was the goal as specified in the QAPP (TAI 2009). However, due to the relatively low catch totals for some species within the >15 to ≤ 30 cm and >30 cm size classes it was necessary to develop composites with three to five individual fish in order to meet the overall goals of the QAPP. The number of fish in each composite is shown in Table 2-17.
- **Sample locations.** In general, sample locations were within the FSCA boundary. In accordance with the QAPP Section A.9.4.2, "The approach to be used for the 2009 fish tissue study is to collect fish from the same six FSCAs used by EPA in 2005 (USEPA 2007). However, if target fish species are not found within the FSCA in a particular reach, then the length of the FSCA may be extended to collect the target number of fish." In FSCA 4, some sample locations occurred outside the FSCA boundaries for two reasons. First, an additional day of sampling occurred at FSCA 4 to target smallmouth bass due to poor initial catch in this area. Fishing areas were targeted based on Tribal guide recommendations and these were

located just north of the FSCA 4 boundary (see Map 2-5). Second, burbot traps generally had poor performance throughout the entire sampling event (see Table 2-7f). Due to poor returns from burbot traps in Reaches 1, 2 and 3, the field team set burbot traps within and outside of FSCA 4 to attempt to collect more burbot. Areas were selected based on recommendations from Tribal guides or based on preferred burbot habitat (e.g., deep water near rocky shorelines). The minimum sampling effort for burbot traps was easily achieved within the boundaries of FSCA 4.

3.2.6 FSCA 5

The following deviations from the QAPP for FSCA 5 are noted:

- **Target species.** For the smallest size class (≤ 15 cm), only four of the desired six species were captured and no insectivorous fish were captured in this reach of this size-class. For the >15 to ≤ 30 cm size class, four of the six targeted species were collected. The largescale sucker composite was made of largescale and longnose sucker species. For the largest size class (>30 cm), targets were not met for smallmouth bass (three of six composites), whitefish (four of the six composites), and largescale and longnose suckers (four of six composites). Although the minimum level of effort was met (and exceeded for some methods) not all of the target fish were collected. A number of factors may have contributed to these reduced numbers (e.g., available habitat, weather, water levels, and/or migration to tributaries).
- **Species identification.** None of the randomly selected fish that were subjected to a species identification review were from this FSCA.
- **Composite numbers.** A minimum of five individual fish per composite was the goal as specified in the QAPP (TAI 2009). However, due to the relatively low catch totals for some species within the >15 to ≤ 30 cm and >30 cm size classes it was necessary to develop composites with three to five individual fish to meet the overall goals of the QAPP. Lake whitefish in the <30 cm size class were all composited as four composites of five fish each (4 times 5), instead of four composites with four fish each (4 times 4), and one composite with five fish (1 times 5) as had been requested by EPA (Bottcher 2010, pers. comm.). The number of fish in each composite is shown in Table 2-17.
- **Sample locations.** In general, sample locations were within the FSCA boundary. In accordance with the QAPP Section A.9.4.2, "The approach to be used for the 2009 fish tissue study is to collect fish from the same six FSCAs used by EPA in 2005 (USEPA 2007). However, if target fish species are not found within the FSCA in a particular reach, then the length of the FSCA may be extended to collect the target number of fish." In FSCA 5, some sample locations for burbot traps

occurred outside the FSCA boundaries. Due to poor returns from burbot traps in Reaches 1, 2 and 3, the field team set burbot traps within and outside of FSCA 5 to collect more samples. Areas were selected based on recommendations from Tribal guides or based on preferred burbot habitat (e.g., deep water near rocky shorelines). Based on Tribal guide recommendations, these burbot traps were located just north of the FSCA 5 boundary (see Map 2-6). The minimum sampling effort for burbot traps was easily achieved within the boundaries of FSCA 5.

3.2.7 FSCA 6

The following deviations from the QAPP for FSCA 6 are noted:

- **Target species.** For the smallest size class (≤ 15 cm), only four of the desired six species were captured and no insectivorous fish were captured of this size-class. For the >15 to ≤ 30 cm size class, only three of the six species were collected and no benthivorous species were encountered. For the largest size class (>30 cm), targets were not met for burbot (five of six composites), kokanee (five of six composites), and lake whitefish (zero of six composites). Although the minimum level of effort was met (and exceeded for some methods) not all of the target fish were collected. A number of factors may have contributed to these reduced numbers (e.g., available habitat, weather, water levels, and/or migration to tributaries).
- **Species identification.** None of the randomly selected fish that were subjected to species identification review were from this FSCA.
- **Composite numbers.** A minimum of five individual fish per composite was the goal as specified in the QAPP (TAI 2009). However, due to the relatively low catch totals for some species within the >15 to ≤ 30 cm and >30 cm size classes it was necessary to develop composites with three to five individual fish to meet the overall goals of the QAPP. The number of fish in each composite is shown in Table 2-17.

4 VALIDATION ASSESSMENT

Environmental Standards Inc. (Valley Forge, PA) performed the quality assurance review on the 2009 fish tissue data. The review was performed with guidance from the *Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use* (EPA-540-R08-008) (USEPA 2009); *U.S. EPA Contract Laboratory Program National Functional Guidelines for Organic Data Review* (EPA/540/R-99/008) (USEPA 1999); *U.S. EPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review* (EPA/540/R-04-004) (USEPA 2004); *EPA Region 10 SOP for the Validation of Method 1668 Toxic, Dioxin-like PCB Data* (USEPA 1995); *EPA Region 10 SOP for the Validation of Polychlorinated Dibenzodioxin (PCDD) and Polychlorinated Dibenzofuran (PCDF) Data* (USEPA 1996); and the requirements specified in the QAPP (TAI 2009).

All fish tissue samples, including laboratory duplicates, have undergone an independent data validation. Data were examined to determine the usability of analytical results and compliance relative to requirements specified above and the analytical methods. In addition, deliverables were evaluated for completeness and accuracy. Qualifier codes have been placed next to results on the data tables to enable the data user to quickly assess the qualitative and/or quantitative reliability of any result based on the criteria evaluated. EPA's QA/QC chemist reviewed draft data and data validation reports. Any and all issues identified during EPA's QA review were resolved and EPA approved the data for use on January 27, 2011. Complete data validation reports are available on the "Downloads" page in the Project Database (<http://teck-ucr.exponent.com>). The following sections summarize results of the validation.

4.1 OVERALL DATA QUALITY

Most (>99 percent) of the data are useable, with the qualifications presented in the validation reports and included in the Project Database. Only useable data were included in this data summary and data gap report (all data, including rejected data, are in the Project Database). Data qualifiers were added to data tables by the laboratories and validators to signify when data were out of calibration range (i.e., below or above levels of quantification), where contaminated blanks compromised data interpretability, or if matrix spikes, internal standards, or other quality control metrics were exceeded. Table 4-1 summarizes the number of samples with each type of data qualifier, by analyte. Refer to the Draft UCR RI/FS Data Management Plan Amendment No. 1 (TAI 2010b), for information regarding how data qualifiers should be used.

Of all the analyses, some data for only seven chemicals were rejected from sample batches with associated quality control problems (Appendix J presents the details of the rejected data). These chemicals were tantalum, titanium, zirconium, PBDE-209, PBDE-203 and 200 (which co-eluted), and PBDE-206 (polybrominated diphenylethers [PBDE]). As shown in

Table 4-1, only one or two samples for zirconium, PBDE-209, PBDE-203 and 200 (which co-eluted), and PBDE-206 were rejected; thus, there remains a large amount of available data for these chemicals. Only 34 of 268 samples analyzed for titanium were rejected, resulting in approximately 87 percent of the data being available for most species in all FSCAs. Many samples for tantalum were rejected, resulting in approximately 15 percent of the data being available. The following is a summary of fish species for which tantalum tissue data are not available:

- None for small fish samples representing FSCAs 2, 3, 4, 5, and 6
- None for medium fish samples representing FSCAs 1, 3, 5, and 6
- None for large burbot samples representing FSCAs 2, 3, 5, and 6
- None for large kokanee samples representing FSCAs 2, 3, 4 and 6
- None for large rainbow trout samples representing FSCAs 2, 4, 5, and 6
- None for large smallmouth bass samples representing FSCAs 1, 2, and 3
- None for large largescale/longnose sucker samples representing FSCAs 1, 2, and 6
- None for large walleye samples representing FSCAs 2, 3, 4 and 6
- None for large whitefish samples representing FSCAs 2, 4, 5, and 6.

Therefore, potential data gaps for tantalum within some FSCAs may exist.

4.2 FIELD HOLDING TIMES AND SAMPLE TRANSPORT

Field holding times were addressed in Section 3.2; details are in Tables 2-8 and 2-12. There were no deviations associated with sample transport.

4.3 FIELD BLANK RESULTS

There were no field blanks for this study as the matrix being collected for analysis (fish tissue) did not lend itself to inclusion of field blanks.

4.4 EQUIPMENT RINSE BLANKS

Equipment rinse blanks were included with each sample delivery group (SDG); thus, a minimum of one rinse blank per twenty samples was prepared. Because analyses were run on a solid matrix (fish tissue) but equipment rinse blanks are necessarily a liquid matrix, blank concentrations were converted to similar units and all data were re-evaluated by the data validators. However, no changes were made as it was found that no data had been unnecessarily qualified as a result of the original approach taken with the equipment blanks.

4.5 LABORATORY HOLDING TIMES

Laboratory holding times were not exceeded for any analyte in any of the samples.

4.6 INORGANICS

All inorganic analyses were conducted by CAS in Kelso, WA, with the exception of arsenic speciation which was performed by Frontier Global Sciences, Inc. in Seattle, WA.

4.6.1 Calibration

Detection limits for antimony, total inorganic arsenic, boron, bismuth, beryllium, chromium, lead, silver, thallium, and uranium in some samples may have been higher than reported, and the “not-detected” values were flagged “UJ” in the database.

High relative percent differences (RPD) (>40 percent) were observed for scandium and zirconium in four samples, chromium in one sample, and other inorganic substances in a few other samples. Results were considered estimates and “J” flagged in the database.

4.6.2 Blanks

Due to their trace-level presence in the associated laboratory and/or equipment blanks, the reported positive results for some analytes in some samples were considered “not-detected” and flagged “U*” in the database.

4.6.3 Surrogate Recovery

Significant negative bias (absolute value >2 times MDL) for a few samples was observed for boron, chromium, and vanadium in the associated interference check samples. Significant positive bias was identified for lithium and titanium in some samples.

4.6.4 Matrix Spike

Some matrix spikes had low recoveries, although associated post-digestion spike results were within acceptance limits for most. Tantalum was the exception, with 85 percent of samples associated with low matrix spike recoveries and therefore qualified as “R” and removed from the dataset. Thirty four out of 268 samples analyzed for titanium were also “R”-flagged and rejected, resulting in approximately 87 percent of the data being available.

Antimony, calcium, fluoride, and zirconium in several samples had matrix spike recoveries <75 percent and were “J” flagged as estimated results. Cadmium, calcium, iron, lead, molybdenum, and selenium had high matrix spike recovery (>125 percent) in a few samples and were also “J” flagged.

4.6.5 Laboratory Control Samples and Standard Reference Material

Lead measurements in the standard reference material (SRM) were high for several samples, which were flagged in the database. Interference sample checks indicated interference in the presence of high concentrations of the interferents for chromium, vanadium, lithium, boron, and titanium. Consequently, some samples were “J” qualified in the database.

4.7 POLYCHLORINATED DIBENZO-P-DIOXINS / POLYCHLORINATED DIBENZOFURANS, POLYCHLORINATED BIPHENYLS AND POLYBROMINATED DIPHENYLETERS

Analysis of samples for polychlorinated dibenzo-p-dioxins (PCDDs)/polychlorinated dibenzofurans (PCDFs), polychlorinated biphenyls (PCBs) and PBDEs was conducted by Vista Analytical Laboratory (Vista) in El Dorado Hills, CA.

Several organic results were qualified as “not-detected” due to blank contamination or as “estimated” due to low extraction standard recovery, field triplicate imprecision, quantitation above the instrument calibration range, out-of-criteria ion abundance ratios, and quantitation between the sample-specific detection limit and reporting limit. Overall, the data reviewed are usable with the qualifications presented in the validation reports and database.

4.7.1 Calibration

The laboratory reported results from several samples that exceeded the instrument calibration range for some PBDE compounds. Data were qualified as “EMPC” (estimated maximum possible concentration) by the laboratory and flagged with a “U” qualifier (not detected) in the database, in compliance with the EPA Region 10 protocol and the EPA Contract Laboratory Program. The laboratory then expanded the calibration range and demonstrated acceptable linearity for the expanded PBDE and PCB congener calibration – the relative standard deviations (RSDs) for all analytes were less than 20 percent.

For undiluted samples, all MDLs reported by Vista were well below the ACG values specified for the project. In cases where dilutions were required, the dilution-adjusted MDLs for a small number of PCB congeners/samples exceeded the ACG values and were quantified only to the ACG level. In this manner, ACGs were met for all analytes.

The concentration of PBDE-209 in the initial calibration curve was higher than concentrations of other congeners. As a result, it was not possible to expand the range of the instrument calibration because PBDE-209 would saturate the column at the highest point. The linearity of the brominated congeners reported above the calibration curve,

was verified using a high-level check standard only containing these select congeners. Nevertheless, the “J” qualifications for results above the initial calibration range were not removed from the validation reports or the database.

Discrepancies in RPD for PCBs were found in one sample.

There were instances in one data reporting group where results for 2,3,7,8-tetrachlorodibenzo-furan (TCDF) in the calibration verification standards analyzed on the confirmation column were outside of the acceptance criteria and the laboratory did not initiate corrective action. In these cases, the project sample results for 2,3,7,8-TCDF reported from the confirmation column were considered quantitative estimates and qualified as such (“J” flagged). Data validators exercised professional judgment in determining whether to report the unqualified primary column instead of the qualified confirmation column results, specifically in cases where interference was not observed and all acceptance criteria on the primary column were met.

One set of samples used 5g instead of 10g when performing extractions for PBDE analyses; the MDLs were adjusted accordingly.

4.7.2 Blanks

Trace-level amounts of PCBs and PBDEs were found in some equipment blanks. Trace levels of all octachlorodibenzodioxins (OCDD) and octachlorodibenzofurans (OCDF) were also found in laboratory and equipment blanks. The reported positive results for the analyses associated with those blanks were considered “not-detected”, and the reported results have been replaced with the detection limit in the database and flagged with a “U*” qualifier.

4.7.3 Field Replicates

Discrepancies were found between the field duplicate/triplicate samples (from less than five times the detection limit to less than two times the detection limit) for two samples. Therefore, the results were considered estimated and flagged with a “J” qualifier.

4.7.4 Surrogate Recovery

Extraction standards for three PBDE congeners were not recovered in the analysis of a few samples. These samples were considered “unusable” and have been flagged “R” in the database.

4.8 ORGANOCHLORINE PESTICIDES

Analysis of samples for organochlorine pesticides was conducted by CAS in Kelso, WA.

4.8.1 Calibration

Detection limits for endrin, endrin aldehyde, endosulfan sulfate, ketone, oxychlorane and toxaphene in some samples may be higher than reported, and the “not-detected” results have been flagged “UJ” in the database. High percent drifts (>15 percent) in the direction, or a decrease in instrument sensitivity, were observed for these compounds in some sample analysis groups.

High percent differences were observed for a few target compounds in a few continuing calibration verification (CCV) standards on one or both chromatographic columns, although, the average percent difference across all compounds in the CCV standards were within acceptance criteria. Data associated with these calibration standards were “J” flagged (estimated) in the project database.

4.8.2 Blanks

Due to their trace-level presence in the associated laboratory and/or equipment blanks, the reported positive results for some analytes in some samples were considered “not-detected” and flagged “U*” in the database.

4.8.3 Matrix Spikes

Very low recoveries (<75 percent) were observed for toxaphene in a few samples that were considered as “not-detected” and flagged as “UJ” in the database.

4.8.4 Laboratory Control Samples and Standard Reference Material

The analyses for *delta*-benzenehexachloride (*delta*-BHC) in several samples were initially qualified as rejected (“R” flagged) and deemed unusable due to very low SRM recoveries. It was subsequently determined that the laboratory misidentified and misreported *delta*-BHC in the SRM analyses. The compound was, in fact, not included in the SRM mixture. As a result, the rejection qualifiers for *delta*-BHC were considered invalid and the samples reclassified as valid data in the project database.

Method detection limits and/or method reporting limits (MRLs) for one or more organochlorine pesticide compounds in some samples were raised by the laboratory due to chromatographic interference. These are flagged as “U” in the database. Results for 2,4-dichloro-diphenyl-trichloroethane (DDT) in several samples were reported from initial five-fold dilutions, due to high concentrations of interfering, non-target compounds and are flagged as “J” in the database.

4.9 VOLATILE AND SEMIVOLATILE ORGANIC CHEMICALS

Analysis of samples for volatile and semivolatile organic chemicals was conducted by CAS in Kelso, WA.

4.9.1 Calibration

The MDLs and/or MRLs for one or more organic chemicals (e.g., di-*n*-butyl phthalate) in several samples were raised due to chromatographic interference. These samples were considered “not-detected” and flagged “U” in the database.

4.9.2 Blanks

Due to their trace-level presence in the associated laboratory and/or equipment blanks, the reported positive results for some analytes in some samples were considered “not-detected” and flagged “U*” in the database.

4.9.3 Matrix Spikes

In some sample reporting groups, low recoveries of matrix spikes were observed for benzo(a)anthracene, 2-methylnaphthalene, and hexachlorocyclopentadiene. These samples were considered as “not-detected” and flagged as “UJ” in the database.

4.9.4 Laboratory Control Samples and Standard Reference Material

Analyses for *cis*-nonachlor in several samples were initially qualified as rejected (“R” flagged) and deemed unusable due to very low SRM recoveries. It was subsequently determined that the laboratory misidentified and misreported *cis*-nonachlor in the SRM analyses. The compound was, in fact, not included in the SRM mixture. As a result, the rejection qualifiers for *cis*-nonachlor were considered invalid and the samples reclassified as valid in the project database.

5 SUMMARY OF AVAILABLE DATA

This section describes availability of useable analytical data for the 2009 fish tissue samples in each chemical class. To facilitate these discussions, Tables 5-1 to 5-5 provide statistical summaries (minimum, arithmetic mean, maximum, and standard deviation) of COI concentrations by fish size class. Concentration data for the COIs analyzed in each fish or composite are shown in Appendix K. Additionally, a series of figures were created to illustrate ranges of concentrations of COIs by FSCA and species (>30 cm fish) or feeding guild (≤ 15 cm and >15 to ≤ 30 cm fish); selected figures are included in this report and the remaining plots are included in Appendix L (see Appendix M for TEQ calculations related to PCBs and dioxin/furans). Table 5-6 presents comparisons of planned and actual number of fish tissue composites for each analysis. This table lists the number of fish tissue composites analyzed by size class, species for fish >30 cm, and chemical analysis. For simplicity, field duplicate samples were treated as primary samples.

As noted in Section 2.3.2, fillets of large fish were collected to provide additional data for the HHRA. Both of the fillets (composited together) and the remainder (i.e., the carcass or tissue remaining after filleting) were analyzed to allow for reconstruction of whole body concentrations using Equation 1. The whole body concentration calculation is further detailed in Appendix K and to facilitate the reconstruction process an example calculation is presented within the aforementioned appendix. An electronic data file with calculated whole body values has been enclosed with this report as well.

To evaluate the usability of available 2009 fish tissue data, actual method detection limits for metals, dioxin/furans, PCBs, PBDEs, pesticides, polycyclic aromatic hydrocarbons (PAHs), and semivolatile organic compounds (SVOCs) are compared to five times the ACG; and are shown in Tables 5-7 through 5-13. Analytical concentration goals were derived by first selecting conservative RBCs for human and ecological receptors. These values are not proposed as the final list of TRVs for the BERA or HHRA, but were used to ensure adequate sensitivity of reported results. The ACG was then calculated as equal to the human health RBC, or one-fifth the fish and wildlife RBC, whichever was lowest. The MDL was expected to be equal to or less than the ACG, which was true for most COIs, although standard laboratory methodology was not expected to be sufficiently sensitive to provide MDLs below the ACG for several analytes (Tables 5-7 through 5-13). In some cases, RBCs were lower than what could technically be achieved so the ACG was set equal to the known MDL, and in other cases the MDL was not known *a priori* (indicated as "TBD" in the tables). Samples that were at or below the MDL were flagged with a "U" in the database to indicate "not detected," and samples between the MDL and the MRL; limit of quantitation were flagged with a "J" to indicate an "estimated" value.

5.1 TARGET ANALYTE LIST METALS/METALLOIDS

A total of 509 composite fish samples of all sizes and from all FSCAs were analyzed for target analyte list (TAL) metals and metalloids, which include aluminum, antimony, arsenic, barium, beryllium, cadmium, calcium, chromium, cobalt, copper, iron, lead, magnesium, manganese, mercury, molybdenum, nickel, potassium, selenium, silver, sodium, thallium, vanadium, and zinc (Table 5-6; Figures 5-1 through 5-4), plus uranium (Table 5-6). A total of 576 composite fish samples of all sizes and from all FSCAs were planned. Of the 36 small fish composites (≤ 15 cm) planned, 34 small fish composites were analyzed (Table 5-6). Six were analyzed from FSCA 1; 7 were analyzed from FSCA 2; 8 were analyzed from FSCA 3; 5 were analyzed from FSCA 4; and 4 each were analyzed from FSCAs 5 and 6 (Table 5-14). Of the 36 medium fish composites (>15 cm to ≤ 30 cm) planned for TAL metals and metalloids analysis, 32 medium fish composites were analyzed (Table 5-6). Four were analyzed from FSCA 1; 5 were analyzed from FSCA 2; 8 were analyzed from FSCA 3; and 5 each were analyzed from FSCA 4, 5, and 6 (Table 5-14). For large fish, 36 composite samples of fillets and remainders each were planned for burbot, kokanee, whitefish, largescale sucker, rainbow trout, smallmouth bass, and walleye. However, not all of the planned composite samples of large fish were collected and available for analysis (Tables 2-18 and 5-14). For instance, only one set of large fish (>30 cm) fillet and remainder composite samples for burbot were analyzed for FSCA 1, only three sets from FSCA 2, only 5 sets from FSCA 3, and only 5 sets from FSCA 6 (Table 5-14), which resulted in a total of 26 composites each of fillet and remainder burbot samples for analysis as opposed to the planned 36 composites each of fillet and remainder burbot samples. In addition, 48 composites each of large fish (>30 cm) fillet and remainder samples of smallmouth bass were available for analysis, with shortages from FSCA 1 (none); FSCA 2 (1 set of samples); FSCA 4 (2 sets of samples); and FSCA 5 (3 sets of samples). However, additional composites of smallmouth bass fillet and remainders were available for FSCA 3 (9 sets in total) and FSCA 6 (9 sets in total). See Table 5-14 for a list of fish samples available for analysis by FSCA, which do not include additional individual fillets analyzed for total mercury analysis (those are shown in Table 5-15).

Additional individual fillets of large smallmouth bass and walleye were analyzed for total mercury, where available (Table 5-15). A total of 281 individual fillet samples of large smallmouth bass and walleye from all FSCAs were analyzed for total mercury in addition to those composite samples discussed above. A total of 360 individual fillet samples of large smallmouth bass and walleye from all FSCAs were planned (Table 5-6). For smallmouth bass, 180 individual fillets were planned, but only 66 individual fillets were analyzed. For walleye, 215 individual fillets were analyzed for total mercury, while only 180 individual fillets were planned.

Analytical concentrations goals, planned MDLs, and actual MDLs for metals and metalloids are shown in Table 5-7. In general, for inorganic substances, only a very small percentage (1.5 percent) of the analyses had MDLs greater than five times the ACG, primarily due to laboratory blank contamination. For most of the COIs (i.e., 98.5 percent of all metals/metalloid analyses), actual MDLs were at or below the planned MDLs, or no more than five times greater than the ACG. The following are exceptions to this:

- The maximum MDL for aluminum, cobalt, lead, and molybdenum in most species
- The maximum MDL for total arsenic in kokanee, sucker, pikeminnow and smallmouth bass samples
- The maximum MDL for barium in largescale sucker samples
- The maximum MDL for chromium in largescale sucker and walleye samples
- The maximum MDL for copper in burbot and sucker samples
- The maximum MDL for nickel in burbot, sucker, and sculpin samples
- All MDLs for mercury in all samples
- The maximum MDL for selenium in kokanee, sucker, whitefish, and smallmouth bass samples.
- The maximum MDL for thallium in burbot, kokanee, whitefish, largescale sucker, smallmouth bass, and walleye samples
- The maximum MDL for uranium in longnose sucker.

However, this bears little consequence on the available data for these metals since the samples contained detectable concentrations of aluminum, arsenic, copper, lead, mercury and selenium above the MDL (see Appendix L).

5.2 NON-TAL METALS/METALLOIDS

A subset of fish composites were analyzed for metals and metalloids other than TAL metals, which include: bismuth, boron, cerium, cesium, dysprosium, erbium, europium, gadolinium, gallium, germanium, gold, holmium, indium, lanthanum, lithium, lutetium, neodymium, niobium, praseodymium, rubidium, samarium, scandium, strontium, tantalum, tellurium, terbium, thorium, thulium, tin, titanium, tungsten, ytterbium, yttrium, and zirconium. In addition, a subset of fillet samples of large fish was analyzed for inorganic arsenic.

A total of 192 composite fish samples of all sizes and from all FSCAs were analyzed for non-TAL metals and metalloids (Table 5-6). A total of 192 composite fish samples of all sizes and from all FSCAs were planned. All of the 12 small fish composites (≤ 15 cm) planned for non-TAL metals and metalloids analysis were analyzed (Table 5-6). Two composites were analyzed from each FSCA. Of the 12 medium fish composites

(>15 cm to ≤30 cm) planned for non-TAL metals and metalloids analysis, 18 medium fish composites were analyzed (Table 5-6). Two each were analyzed from FSCAs 1 and 2, four each were analyzed from FSCAs 3, and 4; three each were analyzed from FSCAs 5 and 6 (Table 5-16). For large fish, 12 composite samples of fillets and remainders each were planned for burbot, kokanee, whitefish, largescale sucker, rainbow trout, smallmouth bass, and walleye. However, not all of the planned composite samples of large fish were collected and available for analysis (Tables 5-6 and 5-16). For instance, 10 remainder composite samples were available for burbot, 10 remainder composites for smallmouth bass, and 9 remainder composites for whitefish were available (Tables 5-6 and 5-16). In some cases, more than 12 composite samples of fillets or remainders were analyzed, such as largescale/longnose suckers (Tables 5-6 and 5-16).

A total of 98 large fish fillet samples from all FSCAs were analyzed for inorganic arsenic (Table 5-6). A total of 108 composite large fish fillet samples from all FSCAs were planned. Thirty six composite samples of fillets were planned for large burbot, and 12 each were planned for kokanee, whitefish, largescale sucker, rainbow trout, smallmouth bass, and walleye. However, not all of the planned composite fillet samples of large fish were collected and available for analysis (Table 5-6). For instance, 26 fillet samples for burbot, 13 fillet samples for kokanee, 10 fillet samples for smallmouth bass, 16 fillet samples for largescale and longnose suckers, 12 fillet samples for rainbow trout, 12 fillet samples for walleye, and 9 fillet samples for whitefish were available (Table 5-17).

Reporting limits for non-TAL metals and metalloids, including inorganic arsenic are shown in Table 5-7. Actual detection limits for these COIs were at or below the planned MDL or no more than five times greater than the ACG, with the following exceptions:

- The maximum MDL for boron in most species
- The maximum MDL for tungsten in burbot samples
- The maximum MDL for zirconium in largescale sucker

Of the above-listed COIs, tungsten and zirconium do not have human or ecological (i.e., fish and wildlife) RBCs, and as such, the resulting elevated MDLs are not anticipated to adversely affect data quality. All boron MDLs were significantly lower than ecological RBCs and as such have no consequence on the available data and its quality for the ecological risk assessment. Similarly, given that ≥86 percent of all boron analyses had MDLs less than the human health RBC identified in the QAPP (TAI 2009), it is not anticipated that the relatively few elevated boron MDLs will adversely affect data quality (see Appendix L).

5.3 DIOXINS/FURANS

A total of 507 composite fish samples of all sizes and from all FSCAs were analyzed for dioxins and furans (Table 5-6; Figures 5-5 through 5-8). A total of 576 composite fish

samples of all sizes and from all FSCAs were planned (Table 5-6). Of the 36 small fish composites (≤ 15 cm) planned for dioxins and furans analysis, 32 small fish composites were analyzed (Table 5-6). Six were analyzed from FSCA 1; seven were analyzed from FSCA 2; eight were analyzed from FSCA 3; four each were analyzed from FSCAs 4 and 5; and three were analyzed from FSCA 6 (Table 5-18). Of the 36 medium fish composites (>15 cm to ≤ 30 cm) planned for dioxins and furans analysis, 32 medium fish composites were analyzed (Table 5-6). Four samples were analyzed from FSCA 1; five were analyzed from FSCA 2; eight were analyzed from FSCA 3; and five each were analyzed from FSCAs 4, 5, and 6 (Table 5-18). For large fish, 36 composite samples of fillets and remainders each were planned for burbot, kokanee, whitefish, largescale sucker, rainbow trout, smallmouth bass, and walleye. However, not all of the planned composite samples of large fish were collected and available for analysis (Tables 2-18 and 5-18). For instance, only one set of fillet and remainder composite samples for burbot were analyzed for FSCA 1 (Table 5-18), which resulted in a total of 26 composites each of fillet and remainder samples for analysis. In addition, 24 composites each of fillet and remainder samples of smallmouth bass were available for analysis, with shortages from FSCA 1 (none); FSCA 2 (1 set of samples); FSCA 4 (2 sets of samples); and FSCA 5 (3 sets of samples). However, additional composites of smallmouth bass fillet and remainders were available for FSCA 3 (9 sets in total) and FSCA 6 (9 sets in total) (Table 5-18).

Detection limits for the dioxin and furan congeners are shown in Table 5-8. Actual MDLs for dioxin and furan congeners were at or below the planned MDL with the exception of the maximum MDL for 2,3,7,8-Tetrachlorodibenzodioxin which was at the ACG for longnose suckers.

5.4 POLYCHLORINATED BIPHENYLS

A total of 576 composite fish samples of all sizes and from all FSCAs were analyzed for PCB congeners (Table 5-6; Figures 5-9 through 5-12). A total of 576 composite fish samples of all sizes and from all FSCAs were planned. Of the 36 small fish composites (≤ 15 cm) planned for PCB congener analysis, 32 small fish composites were analyzed (Table 5-6). Six were analyzed from FSCA 1; seven were analyzed from FSCA 2; eight were analyzed from FSCA 3; four each were analyzed from FSCAs 4 and 5; and three were analyzed from FSCA 6 (Table 5-18). Of the 36 medium fish composites (>15 cm to ≤ 30 cm) planned for PCB congener analysis, 32 medium fish composites were analyzed (Table 5-6). Four samples were analyzed from FSCA 1; five were analyzed from FSCA 2; eight were analyzed from FSCA 3; and five each were analyzed from FSCAs 4, 5, and 6 (Table 5-18). For large fish, 36 composite samples of fillets and remainders each were planned for burbot, kokanee, whitefish, largescale sucker, rainbow trout, smallmouth bass, and walleye. However, not all of the planned composite samples of large fish were collected and available for analysis (Table 5-6). For instance, only one set each of fillet and remainder composite samples for burbot were analyzed for FSCA 1 (Table 5-18), which

resulted in a total of 26 composites each of fillet and remainder samples for analysis. In addition, 24 composites each of fillet and remainder samples of smallmouth bass were available for analysis, with shortages from FSCA 1 (none); FSCA 2 (1 set of samples); FSCA 4 (2 sets of samples); and FSCA 5 (3 sets of samples). However, additional composites of smallmouth bass fillet and remainders were available for FSCA 3 (9 sets in total) and FSCA 6 (9 sets in total) (Table 5-18).

Detection limits for PCBs congeners are shown in Table 5-9. Actual MDLs for PCB congeners were at or below the planned MDL, with the exception of 3-onochlorobiphenyl, Coelution of PCB 12 and 13, Coelution of PCB 44, 47, and 65, and PCB Congener 14 in which actual MDLs were above the planned MDLs but less than five times the ACGs for some species (Table 5-9).

5.5 POLYBROMINATED DIPHENYLEETHERS

A total of 184 composite fish samples of all sizes and from all FSCAs were analyzed for PBDE congeners (Table 5-6). A total of 192 composite fish samples of all sizes and from all FSCAs were planned. All 12 small fish composites (≤ 15 cm) planned for PBDE congener analysis were analyzed (Table 5-6). One composite was analyzed from each FSCA except for FSCA 6 where there were none (Table 5-19). Of the 12 medium fish composites (>15 cm to ≤ 30 cm) planned for PBDE congener analysis, 13 medium fish composites were analyzed (Table 5-6). Two composites were analyzed from each FSCA except six were analyzed from FSCA 6 (Table 5-19). For large fish, 12 composite samples of fillets and remainders each were planned for burbot, kokanee, whitefish, largescale sucker, rainbow trout, smallmouth bass, and walleye. However, not all of the planned composite samples of large fish were collected and available for analysis (Tables 5-6 and 5-19). For instance, ten fillet and remainder composite samples were available for burbot, nine fillet and remainder composites for smallmouth bass, and nine fillet remainder composites for whitefish were available (Table 5-19). In some cases, more than 12 composite samples of fillets or remainders were analyzed, including for kokanee, largescale/longnose suckers, and walleye (Table 5-19).

Detection limits for PBDEs congeners are shown in Table 5-10. Actual MDLs for many PBDEs (approximately 98 percent of all analyses) were at or below the planned MDL or no more than five times greater than the ACG. The following PBDEs were observed to have elevated MDLs:

- The maximum MDLs for PBDEs -28, -47, -49, -66, -100, -153, and -154 in burbot samples were greater than five times the ACG
- The maximum MDLs for PBDE-99 in burbot, largescale and longnose sucker samples were greater than five times the ACG

- The maximum MDLs for PBDE-183 in burbot, rainbow trout, smallmouth bass and walleye samples were greater than five times the ACG
- The maximum MDL for PBDE-206 in burbot, kokanee, rainbow trout, and walleye samples were greater than five times the ACG
- The maximum MDL for PBDE-209 in burbot, kokanee, lake whitefish, largescale sucker, mountain whitefish, rainbow trout, and walleye samples were greater than five times the ACG.

The above-listed represent approximately 2 percent of all PBDE analyses completed for the 2009 Study. Although there is uncertainty associated with the absolute concentrations for the above-listed nondetectable PBDE congeners; this uncertainty is not anticipated to affect overall data quality as it represents a very small percentage of available PBDE data, for which no human health or ecological RBCs are available.

5.6 ORGANOCHLORINE PESTICIDES

A total of 187 composite fish samples of all sizes and from all FSCAs were analyzed for organochlorine pesticides (Table 5-6). A total of 192 composite fish samples of all sizes and from all FSCAs were planned (Table 5-6). All 12 of the planned small fish composites (≤ 15 cm) were analyzed (Table 5-6). Two composites were analyzed from each FSCA (Table 5-20). Of the 12 medium fish composites (>15 cm to ≤ 30 cm) planned for organochlorine pesticides analysis, 13 medium fish composites were analyzed (Table 5-6). Two samples each were analyzed from FSCA except for FSCA where three composites were analyzed. (Table 5-20). For large fish, 12 composite samples of fillets and remainders each were planned for burbot, kokanee, whitefish, largescale sucker, rainbow trout, smallmouth bass, and walleye. However, not all of the planned composite samples of large fish were collected and available for analysis (Tables 5-6 and 5-20). For instance, ten fillet and remainder composite samples were available for burbot, 10 fillet and remainder composites for smallmouth bass, and 9 fillet and remainder composites for whitefish were available (Table 5-20). More than 12 (16) composite samples of fillets and remainders were analyzed for largescale/longnose suckers (Table 5-20).

Detection limits for organochlorine pesticides are shown in Table 5-11. Actual MDLs for many organochlorine pesticides (approximately 76 percent of all analyses) were at or below the planned MDL or no more than five times greater than the ACG. For the remaining 24 percent of the analyses, the maximum MDL was greater than five times the ACG.

With the exception of total chlorodane and hexachlorobutadiene, which were respectively observed to have elevated MDLs in 71 percent and 64 percent of analyzed samples, other organochlorine pesticides (e.g., methoxychlor, 4,4'-dichlorodiphenyldichloroethylene (DDE), 2,4'-DDT; refer to Table 5-11) had concentrations at or below the planned MDL or

no more than five times greater than the ACG within ≥ 81 percent of the analyses. As a result, although there is uncertainty associated with the absolute concentrations for a fraction of these data; this uncertainty is not anticipated to affect overall data quality.

The elevated MDLs for total chlordane and hexachlorobutadiene in a significant portion of the analyses represents an uncertainty because the concentrations in many composite samples of fish were below the MDL, thus resulting in many non-detect samples (Appendix L). As outlined in Section 4.8, given that these non-detects were the result of blank contamination and/or chromatographic interference, it is unknown if lower MDLs would have resulted in more samples with detectable concentrations. Regardless risk assessors should be aware of this uncertainty.

5.7 POLYCYCLIC AROMATIC HYDROCARBONS

A total of 187 composite fish samples of all sizes and from all FSCAs were analyzed for PAHs (Table 5-6). A total of 192 composite fish samples of all sizes and from all FSCAs were planned (Table 5-6). All 12 of the planned small fish composites (≤ 15 cm) were analyzed (Table 5-6). Two composites were analyzed from each FSCA (Table 5-20). Of the 12 medium fish composites (>15 cm to ≤ 30 cm) planned for PAH analysis, 13 medium fish composites were analyzed (Table 5-6). Two samples each were analyzed from FSCA except for FSCA where three composites were analyzed (Table 5-20). For large fish, 12 composite samples of fillets and remainders each were planned for burbot, kokanee, whitefish, largescale sucker, rainbow trout, smallmouth bass, and walleye. However, not all of the planned composite samples of large fish were collected and available for analysis (Tables 5-6 and 5-20). For instance, ten fillet and remainder composite samples were available for burbot, ten fillet and remainder composites for smallmouth bass, and nine fillet and remainder composites for whitefish were available (Table 5-20). More than 12 (16) composite samples of fillets and remainders were analyzed for largescale/longnose suckers (Table 5-20).

Detection limits for PAHs are shown in Table 5-12. Actual MDLs for PAHs (approximately 77 percent of all analyses) were at or below the planned MDL or no more than five times greater than the ACG. For the remaining 23 percent of the analyses, the maximum MDL was greater than five times the ACG at least once.

Elevated detection limits for these PAHs (e.g., anthracene, chrysene, and benzo[a]anthracene) represent an uncertainty because concentrations of these PAHs in many composite samples of fish were below the MDL, thus resulting in many non-detect samples. As illustrated within Appendix L however, even in these instances in which the maximum elevated MDL was greater than five times the ACG, a significant proportion of these analyses (77 percent on average) had MDLs at or below the planned MDL or no more than five times greater than the ACG. As a result, although there is uncertainty associated with the absolute concentrations for a portion of these data; this uncertainty is

not anticipated to affect overall data quality. As outlined in Section 4.9, given that these non-detects were largely the result of chromatographic interference, it is unknown if lower MDLs would have resulted in more samples with detectable concentrations.

5.8 SELECTED SEMI-VOLATILE ORGANIC COMPOUNDS

A total of 187 composite fish samples of all sizes and from all FSCAs were analyzed for SVOCs (Table 5-6). A total of 192 composite fish samples of all sizes and from all FSCAs were planned for SVOC analysis (Table 5-6). All 12 of the planned small fish composites (≤ 15 cm) were analyzed (Table 5-6). Two composites were analyzed from each FSCA (Table 5-20). Of the 12 medium fish composites (>15 cm to ≤ 30 cm) planned for SVOC analysis, 13 medium fish composites were analyzed (Table 5-6). Two samples each were analyzed from FSCA except for FSCA where 3 composites were analyzed (Table 5-20). For large fish, 12 composite samples of fillets and remainders each were planned for burbot, kokanee, whitefish, largescale sucker, rainbow trout, smallmouth bass, and walleye. However, not all of the planned composite samples of large fish were collected and available for analysis (Tables 5-6 and 5-20). For instance, 10 fillet and remainder composite samples were available for burbot, 10 fillet and remainder composites for smallmouth bass, and 9 fillet and remainder composites for whitefish were available (Table 5-20). More than 12 (16) composite samples of fillets and remainders were analyzed for largescale/longnose suckers (Table 5-20). Detection limits for SVOCs are shown in Table 5-13. For most of the SVOCs (approximately 79 percent of all analyses), actual MDLs were above the planned MDL but no more than five times greater than the ACG. The following SVOCs were observed to have a maximum MDL greater than five times the ACG:

- The maximum MDLs for 1,1'-biphenyl in lake whitefish, suckers, rainbow trout, smallmouth bass, and walleye were greater than five times the ACG
- The maximum MDL for bis(2-ethylhexyl) phthalate in rainbow trout and smallmouth bass samples were greater than five times the ACG
- All of the maximum MDLs for butyl benzyl phthalate in all analyzed fish were greater than five times the ACG
- The maximum MDLs for di-n-butyl phthalate in kokanee, lake whitefish, largescale suckers, rainbow trout, smallmouth bass and walleye samples were greater than five times the ACG
- The maximum MDL for di-n-octyl phthalate in longnose sucker and rainbow trout samples were greater than five times the ACG
- All of the MDLs for pentachlorophenol in all analyzed fish samples were greater than five times the ACG.

Of the above-listed, 99 percent for di-n-octyl phthalate, 98 percent for bis(2-ethylhexyl) phthalate, 83 percent for 1,1'-biphenyl, and 66 percent for di-n-butyl phthalate analyses had MDLs at or below the planned MDL or no more than five times greater than the ACG, respectively. As a result, although there is uncertainty associated with the absolute concentrations for a fraction of these data (e.g., 1 to 34 percent); this uncertainty is not anticipated to affect overall data quality.

Only data for pentachlorophenol and butyl benzyl phthalate, where 100 percent of analyses had elevated detection limits, is a potential to represent an uncertainty in the risk assessment. As outlined in Section 4.9, given that these non-detects were largely the result of chromatographic interference, it is unknown if lower MDLs would have resulted in more samples with detectable concentrations. Regardless risk assessors should be aware of this uncertainty.

5.9 LIPID AND MOISTURE CONTENT

A total of 504 composite fish samples of all sizes and from all FSCAs were analyzed for lipid content (Table 5-6). A total of 576 composite fish samples of all sizes and from all FSCAs were planned for lipid analysis (Table 5-6). Of the 36 small fish composites (≤ 15 cm) planned for lipid content analysis, 32 small fish composites were analyzed (Table 5-6). Six were analyzed from FSCA 1; seven were analyzed from FSCA 2; eight were analyzed from FSCA 3; four each were analyzed from FSCAs 4 and 5; and three were analyzed from FSCA 6 (Table 5-21). Of the 36 medium fish composites (>15 cm to ≤ 30 cm) planned for lipid content analysis, 31 medium fish composites were analyzed (Table 5-6). Three samples were analyzed from FSCA 1, five samples were analyzed from FSCA 2, eight samples were analyzed from FSCA 3, and five each were analyzed from FSCAs 4, 5, and 6 (Table 5-21). For large fish, 36 composite samples of fillets and remainders each were planned for burbot, kokanee, whitefish, largescale sucker, rainbow trout, smallmouth bass, and walleye. However, not all of the planned composite samples of large fish were collected and available for analysis (Table 5-6). For instance, one set of fillet and remainder composite samples for burbot were analyzed for FSCA 1, which resulted in a total of 26 composites each of burbot fillet and remainder samples for analysis (Tables 5-6 and 5-21). In addition, 24 each of fillet and remainder samples of smallmouth bass were available for analysis, with shortages from FSCA 1 (none), FSCA 2 (1 set of samples), FSCA 4 (2 sets of samples) and FSCA 5 (3 sets of samples) (Table 5-21). However, additional composites of smallmouth bass fillet and remainders were available for FSCA 3 (9 sets in total) and FSCA 6 (9 sets in total) (Table 5-21).

A total of 789 composite fish samples of all sizes and from all FSCAs were analyzed for moisture content (Table 5-6). A total of 576 composite fish samples of all sizes and from all FSCAs were planned (Table 5-6). Of the 36 small fish composites (≤ 15 cm) planned for moisture content analysis, 34 small fish composites were analyzed (Table 5-6). Six composites were analyzed from FSCA 1; seven composites were analyzed from

FSCA 2; eight were analyzed from FSCA 3; five were analyzed from FSCA 4; and four each were analyzed from FSCAs 5 and 6 (Table 5-22). Of the 36 medium fish composites (>15 cm to ≤30 cm) planned for moisture content analysis, 32 medium fish composites were analyzed (Table 5-6). Four samples were analyzed from FSCA 1, five samples were analyzed from FSCA 2, eight samples were analyzed from FSCA 3, and five each were analyzed from FSCAs 4, 5, and 6 (Table 5-22). For large fish, 36 composite samples of fillets and remainders each were planned for burbot, kokanee, whitefish, largescale sucker, rainbow trout, smallmouth bass, and walleye. However, not all of the planned composite samples of large fish were collected and available for analysis (Tables 5-6 and 5-22). For instance, 1 set of fillet and remainder composite samples for burbot were analyzed for FSCA 1 (Table 5-22), which resulted in a total of 26 composites each of burbot fillet and remainder samples for analysis. In addition, 23 composites each of fillet and remainder samples of whitefish were available for analysis, with shortages from FSCA 1 (3 sets of samples), FSCA 2 (4 set of samples), FSCA 5 (4 sets of samples), and FSCA 6 (none) (Table 5-22). However, additional individual fillet samples of walleye and smallmouth bass were available for moisture content analysis (these samples were also analyzed for total mercury, Section 5.1).

6 ASSESSMENT OF DATA GAPS

In this section a discussion of data gaps relative only to study design, not the HHRA or BERA, is presented. In order to determine if there are data gaps, the following questions were answered:

1. Were all targeted fish obtained and analyzed?
2. Are there analytical data for at least one fish species representative of major feeding guilds?
3. Are there sufficient data from each size class to represent the variety of wildlife diets?
4. Were all analytes measured appropriately and at sufficiently low detection levels?
5. Are there sufficient fish tissue data to represent each FSCA?

A final determination of data adequacy and sufficiency will be made during the preparation of the BERA. The discussion presented in this section is an initial assessment meant to determine if there is an obvious and immediate need to collect additional fish prior to initiating work on the risk assessment.

6.1 NUMBER OF SAMPLES OBTAINED AND ANALYZED

Table 5-6 compares the numbers of planned fish tissue samples for analysis to the numbers of samples that were actually analyzed. There are 10 fewer fish than planned for the small whole body fish composites when samples from all FSCAs are considered. For medium whole body fish composites, there were only two fewer samples analyzed than planned. Two more medium whole body fish composites were analyzed for non-TAL metals than planned, and one additional sample each for PAHs, organochlorine pesticides, PBDEs, and SVOCs. While there were shortages for large fish when sample numbers for all FSCAs are combined, at least sixty percent of the total numbers of planned samples of large fish were actually analyzed. There are no cases where no analytical data are available for a planned analysis for any given fish size class or FSCA (Table 5-6).

Despite meeting and sometimes exceeding the sampling effort targets targeted fish species were not always obtained from FSCAs. Shortages for small (≤ 15 cm) fish composite samples include two whole body composites of small insectivores (rainbow trout and pikeminnow) from FSCAs 4, 5, and 6. However, additional small fish from other feeding guilds were collected and analyzed to supplement the small fish composite totals. As a result, the goal of six whole body composite samples of small fish for each FSCA increased to 5 (FSCA 4) and 4 (FSCAs 5 and 6). Shortages of medium (>15 to

≤30 cm) fish composite samples include one whole body composite of medium benthivores (largescale and longnose suckers) from FSCAs 1, 4, and 5 and two from FSCA 6, as well as two whole body composite of medium piscivores (walleye, smallmouth bass, and pikeminnow) from FSCA 1 and one from FSCA 2. However, samples of rainbow trout, which is considered an omnivore at a size >15 cm, were included in this size class, as well as additional medium fish from other feeding guilds to supplement the medium fish composite samples. As a result, the goal of six whole body composite samples of medium fish was nearly met, with five composites in each FSCA, except there were four in FSCA 1 and eight in FSCA 3.

Shortages of large (>30 cm) fish fillet and remainder composite samples were as follows:

- Burbot—Five sets of fillet and remainder samples from FSCA 1, 3 sets of fillet and remainder samples from FSCA 2, and 1 set of fillet and remainder samples each from FSCAs 3 and 6
- Kokanee—One set of fillet and remainder samples from FSCA 6
- Whitefish—Three sets of fillet and remainder samples from FSCA 1, 2 sets of fillet and remainder samples each from FSCAs 2 and 5, and 6 samples from FSCA 6
- Suckers—Three sets of fillet and remainder samples from FSCA 1, 1 set of fillet and remainder samples from FSCA 3, and 2 sets of fillet and remainder samples from FSCA 5
- Smallmouth bass—Six sets of fillet and remainder samples from FSCA 1, 5 sets of fillet and remainder samples from FSCA 2, 4 sets of fillet and remainder samples from FSCA 4, 3 sets of fillet and remainder samples from FSCA 5
- Walleye—One set of fillet and remainder samples from FSCA 1.

As outlined above, there were instances in which capture rates for certain species within FSCAs fell short of planned rates. There were also instances in which capture rates within FSCAs exceeded planned rates for certain species (e.g., smallmouth bass). As a result, to supplement the above-listed shortages and consistent with EPA's direction, large fish captured in excess of planned rates within adjacent FSCAs were also analyzed increasing the overall available data set. Specific examples in which capture rates exceeded planned rates, resulting in additional data are as follows:

- Smallmouth bass—Three sets of fillet and remainder samples from both FSCA 3 and FSCA 6
- Suckers—Five sets of fillet and remainder samples from FSCA 2 and 8 sets of fillet and remainder samples from FSCA 4.

Despite satisfying and often exceeding design sampling efforts, capture rates for certain species of large fish within some FSCAs did not meet planned capture rates.

Nevertheless, these data in conjunction with data collected in 2005 (USEPA 2007) are anticipated to provide adequate fish tissue concentration data for use in the risk assessment.

6.2 REPRESENTATION OF MAJOR FEEDING GUILDS

Samples of fish representing all major feeding guilds were collected from each of the FSCAs. Whole body samples of small fish (≤ 15 cm) from three feeding guilds (omnivores, insectivores and benthivores) and medium fish (> 15 to ≤ 30 cm) from four feeding guilds (omnivores, insectivores, piscivores, and benthivores) were obtained and analyzed from most FSCAs. However, there were some size classes that did not have all their feeding guilds represented within two of the FSCAs. Specifically, small insectivorous fish were not obtained from FSCAs 4, 5 and 6, medium omnivorous fish were not obtained from FSCAs 5 and 6, and medium piscivorous fish were not obtained from FSCA 1 (Table 2-18). Nevertheless, while certain feeding guilds were not present in all size classes of fish from a given FSCA, those feeding guilds were represented by fish in other size classes within that same FSCA.

6.3 REPRESENTATION OF WILDLIFE DIET

The QAPP identified fish species and size classes that are key components in the diet of representative piscivorous wildlife species (Table A-6 of the QAPP; TAI 2009). These data were used to select target species and size classes of fish for the 2009 fish tissue study. Below are discussions regarding the availability of adequate fish tissue concentration data to represent the diet of representative piscivorous wildlife species.

Bald eagles consume a variety of fish, including largescale sucker, American shad, common carp, other cyprinids, salmon, steelhead, black crappie, other centrarchids, yellow perch, sturgeon, shiner perch, trout, hardhead, Sacramento squawfish, Tui chub, Sacramento sucker, channel catfish, and brown bullhead (Watson et al. 1991; Jackman et al. 1999). During breeding season, bald eagles consume a large amount of smaller (< 10 cm) fish than larger (> 60 cm) fish (Watson et al. 1991). Outside of breeding season, bald eagles consume a larger amount of larger (> 60 cm) fish than smaller (< 10 cm) fish (Watson et al. 1991). Bald eagles also consume fish ranging from 129 to 854 cm (Jackman et al. 1999). Therefore, the diet of the bald eagle contains a variety of freshwater fish species of varying sizes and feeding guilds. As shown in Tables 2-18 and 5-6, sufficient COI concentration data are available for fish found in the diet of the bald eagle, including rainbow trout, kokanee, and largescale and longnose suckers, from all FSCAs.

Ospreys consume brown bullhead, rainbow trout, kokanee, mountain whitefish, northern squawfish, yellow perch, and largescale sucker, and the majority of the fish consumed are between 11 and 30 cm (Van Daele and Van Daele 1982). There are COI concentration data for four to eight whole body composites of medium (> 15 cm to ≤ 30 cm) fish from a variety

of feeding guilds from each FSCA (Tables 2-18 and 5-6). Therefore, there is sufficient fish tissue data to represent the diet of the osprey.

Great blue herons consume a variety of freshwater fish, with the majority of fish consumed between 5 and 15 cm (Alexander 1977). Belted kingfishers also consume a variety of freshwater fish, with the majority of fish consumed between 6 and 12 cm (Davis 1982; Salyer and Lagler 1949; Alexander 1977). There are COI concentration data for at least four whole body composites of small (≤ 15 cm) fish from a variety of feeding guilds from each FSCA (Tables 2-18 and 5-6). Therefore, there is sufficient fish tissue data to represent diets of the great blue heron and belted kingfisher.

Otters consume a variety of fish, including burbot, cyprinids, trout, pike, perch, eel and roach (Erlinge 1969; Wise et al. 1981). The majority of fish consumed by otter observed by Erlinge (1969) were burbot between 17 and 24 cm. In the study by Wise et al. (1981), the sizes of fish consumed by otter varied by species. The majority of roach were between 9 and 15 cm, whereas the majority of salmonids were between 0 and 15 cm, and the majority of eels were between 20 and 40 cm. EPA's *Wildlife Exposure Factor Handbook* (USEPA 1993) states that 50 percent of fish consumed by the otter are between 11 and 20 cm, and the other 50 percent are >20 cm. There are COI concentration data for at least thirteen composites of large (>30 cm) burbot, kokanee, and rainbow trout from each FSCA (Tables 2-18 and 5-6). In addition, there are COI concentration data for five whole body composites of medium (>15 cm to ≤ 30 cm) fish from a variety of feeding guilds from each FSCA (except four from FSCA 1) (Tables 2-18 and 5-6). Therefore, there is sufficient fish tissue data to represent the diet of the otter.

Mink consume a variety of fish, including burbot, cyprinids, trout, pike, perch, eel and roach (Erlinge 1969; Wise et al. 1981). The majority of fish consumed by mink observed by Erlinge (1969) were greater than 15 cm. In the study by Wise et al. (1981), sizes of fish consumed by mink varied by species. The majority of roach, perch and salmonids were between 0 and 15 cm, whereas the majority of pike were between 20 and 50 cm, and the majority of eels were between 20 and 40 cm. Alexander et al. (1977) found the majority of fish consumed by mink were between 5 and 13 cm. There are COI concentration data for at least thirteen composites of large (>30 cm) burbot, kokanee, and rainbow trout from each FSCA (Tables 2-18 and 5-6). In addition, there are COI concentration data for at least five whole body composites of medium (>15 cm to ≤ 30 cm) fish from a variety of feeding guilds from each FSCA (except 4 in FSCA 1) (Tables 2-18 and 5-6). Therefore, there is sufficient fish tissue data to represent the diet of the mink.

6.4 CHEMICAL ANALYSIS AND DETECTION LIMITS

Analytical methods for determining COI concentrations are standard EPA methods (see Table 2-1). During development of the QAPP (TAI 2009), certain analytical methods were selected over others to achieve lower detection limits. The methods of analysis of

COIs in fish tissue samples matched methods of analysis of COIs presented in the QAPP (TAI 2009). Methods for lipid and moisture content were not specified in the QAPP to be EPA methods, but were described as freeze/dry and gravimetric methods, which are appropriate. Therefore, all data were analyzed appropriately and in accordance with the QAPP (TAI 2009).

Actual MDLs were compared to five times the ACGs for metals/metalloids, dioxin/furans, PCBs, PBDEs, pesticides, PAHs and SVOCs (TAI 2009). As detailed within Section 5, because ACGs were conservatively set at one-fifth the fish and wildlife RBC, or set equal to the human health RBC (whichever was lowest), nondetect samples are considered adequately sensitive for use in the RI/FS. A summary of actual MDLs versus five times the ACGs for all COI analyses is shown in Tables 5-7 through 5-13. As illustrated within Tables 5-8 and 5-9 respectively, actual MDLs for all dioxins/furans and PCBs were at or below the planned MDL or no more than five times greater than the ACG.

It is important to note that if only one analysis for a given COI had an actual MDL that exceeded the planned MDL or was five times greater than the ACG, it was accordingly highlighted within the aforementioned tables (Tables 5-7 through 5-13). As detailed within Section 5 however, with the exception of four COIs (i.e., total chlorodane, hexachlorobutadiene, pentachlorophenol, and butyl benzyl phthalate); actual MDLs even for 'highlighted' COIs (refer to Tables 5-7 through 5-13) were largely at or below the planned MDL or no more than five times greater than the ACG.

Due to chromatographic interference, MDLs for total chlorodane, hexachlorobutadiene, pentachlorophenol, and butyl benzyl phthalate did not meet planned MDLs and were often observed to be greater than five times the ACG. Specifically, 71 percent and 64 percent of the analyses for total chlorodane and hexachlorobutadiene were respectively observed to have MDLs greater than five times the ACG. Despite actual MDLs meeting or not exceeding five times the ACG for the aforementioned organochlorine pesticides 29 - 36 percent of time, there is uncertainty associated with the data that risk assessors should consider.

Similarly, MDLs for the SVOCs pentachlorophenol and butyl benzyl phthalate, did not meet planned MDLs, chromatographic interference, and were observed to be greater than five times the ACG for all analyses. As a result, there is uncertainty associated with the concentrations for these two COIs which will need to be considered during the risk assessment.

6.5 REPRESENTATION OF FSCAS

As discussed in Section 6.1, all targeted fish were not obtained from each FSCA (Table 2-18). A goal of six composite samples for small (≤ 15 cm) and medium (≥ 15 to ≤ 30 cm) size classes, and six composite samples for each species of the >30 cm size class was targeted from each FSCA, for a total of 576 composite samples (whole body, fillet,

and remainder composites). For TAL metals which were to be measured in all fish collected (Table 5-14), benthivorous and insectivorous small fish were under-represented in FSCAs 4, 5 and 6, and omnivorous small fish were under-represented in FSCA 1. Medium size benthivores were under-represented in FSCAs 1,4, 5 and 6, and medium sized piscivores were not collected from FSCA 1. For large fish, burbot and smallmouth bass were under-represented in FSCA 1, and whitefish were absent from FSCA 6. All other feeding guilds and size classes were represented within each FSCA at ≥ 50 percent of target levels.

Two samples per species and size class for each FSCA were targeted for analysis of the non-TAL metals, congeners of dioxins, furans and PCBs, PBDEs, organochlorine pesticides, PAHs and SVOCs. Actual numbers analyzed are shown in Table 5-7 through 5-13, respectively. In general, one or two samples were analyzed for each feeding guild/age group within each FSCA, but there were some data gaps. For example, there were no medium insectivores analyzed for non-TAL metals, and large smallmouth bass were consistently absent from FSCA 1; while whitefish were not found in FSCA 6. Some analyte groups had more than the required samples analyzed in some FSCAs. For example, PCBs, dioxins, and furans were analyzed in five fish from many sizes/feeding guilds (Table 5-18).

In general, all FSCAs are well represented by all age (size) classes within each analyte group, but a few fish feeding guilds were absent from some FSCAs. This may reflect the differences in habitat among FSCAs, especially between FSCA 1 (high energy, lotic system; smallmouth bass absent) and FSCA 6 (lower energy, lentic system; whitefish absent).

7 SUMMARY AND RECOMMENDATIONS

A large number of fish tissue samples representing a variety of feeding guilds and size classes important for conducting ecological and human health risk assessments was obtained and analyzed for COIs. While not all target fish were obtained for chemical analysis, the available fish tissue data met the stated DQOs in the QAPP (TAI 2009). The data appear to be representative of fish present in each FSCA and major feeding guilds within the UCR. In addition, available fish tissue data appear to be sufficient to represent the primary components of piscivorous wildlife diets that may be evaluated in the ecological risk assessment. All samples were analyzed for COIs appropriately and in accordance with the QAPP (TAI 2009). For most samples (i.e., 98 percent), actual MDLs met the planned MDLs or were no greater than five times the ACGs. Four COIs (i.e., total chlorodane, hexachlorobutadiene, pentachlorophenol, and butyl benzyl phthalate) had a high percentage (ranging from 64 to 100 percent of the analyses) of non-detects for which actual MDLs did not meet planned MDLs or were five times greater than the ACG due to chromatographic interference. As a result, there is uncertainty associated with the concentrations for these four COIs.

In summary, it appears that there are no significant data gaps relative to the QAPP (TAI 2009) that would suggest additional fish tissue data are needed prior to conducting ecological and human health risk assessments. However, the final determination of data sufficiency will be made during the preparation of the BERA and HHRA. During that time and consistent with Guidance (USEPA 1997), should EPA determine that there is insufficient information to support informed risk-based management decisions, additional fish tissue data may be needed. At this time however, based on results from the 2009 data collection activity, fish tissue data appear representative of targeted species, size classes, and major feeding guilds within targeted sample collection areas outlined in the QAPP (TAI 2009).

TABLES

Table 2-1. Methods for Analysis of COIs in Fish Tissue Samples

Analytes	Analytical Method	Description
Metals/Metalloids	EPA Method 6010	ICP-AES
	EPA Method 6020	ICP-MS
	EPA Method 1631E (Hg)	CV-AAS
	EPA Method 7000 Series Methods (various metals)	
Fluoride	EPA340.2_3	
Inorganic Arsenic	EPA Method 1632A	HG-QFAAS
PCBs (Congeners)	EPA Method 1668A	HRGC/HRMS
Dioxins/Furans	EPA Method 1613B	HRGC/HRMS
PBDEs	EPA Method 1614	HRGC/HRMS
PAHs	EPA Method 8270C SIM	GC-MS/SIM
Pentachlorophenol	EPA Method 8151A	GC-ECD
Chlorinated Pesticides	EPA Method 8081A	GC-ECD
SVOCs	EPA Method 8270C SIM	GC-MS/SIM
% Lipids		Freeze dry/Gravimetric
% Moisture		Freeze dry/Gravimetric

Notes:

CV-AAS	Cold vapor-atomic adsorption spectrometry
GC-ECD	Gas chromatography-electron capture detection
GC-MS/SIM	Gas chromatography-mass spectrometry-selected ion monitoring
HG-QFAAS	Hydride generation-quartz furnace atomic adsorption spectrometry
HRGC/HRMS	High resolution gas chromatography/high resolution mass spectrometry
ICP-AES	Inductively coupled plasma-atomic emission spectrometry
ICP-MS	Inductively coupled plasma-mass spectrometry

Notes:

- RBC - Risk-based concentration
- ACG - Analytical concentration goals
- MDL - Method detection limit
- n/a - Not available
- MRL - Method reporting limit
- TBD - To be determined

Table 2-2. Target Analyte List, Risk Based Concentrations, Laboratory Reporting Limits and Analytical Concentration Goals

Analyte	Risk Based Concentrations (RBCs)				Laboratory		2009 ACGs ^e
	Human Health ^a	Fish ^b	Fish RBC/5	Piscivorous Wildlife ^c	Wildlife RBC/5	MRL ^d	

^a Lowest Fish RBCs for Human Health provided by EPA, Region 10 (see Appendix E of the QAPP [TAI 2009]).

^b Fish RBCs for metals are listed as dry weight no-observed-adverse-effects-concentrations in food of fish. For organics, concentrations are provided as wet weight concentrations in whole fish. Source: Windward (2004), except where noted

^c Wildlife RBCs derived from the exposure factors and TRVs provided in the draft SLERA (TAI 2010a). Additional TRVs identified from Sample et al. (1996). Wildlife RBCs represent the lowest concentration for piscivorous wildlife (great blue heron, osprey, belted kingfisher, mink, and otter) using the following equation:

$$\text{Wildlife RBC (mg/kg-ww)} = (\text{TRV} \times \text{BW}) / (\text{FIR})$$

Where: TRV - Toxicity reference value (mg/kg-day)

BW - Body weight (kg)

FIR - Food ingestion rate (kg/d-wet)

^d MRLs and MDLs obtained from Columbia Analytical Services (CAS). Metals MDLs/MRLs are on a dry weight basis, the rest are wet weight.

^e ACGs represent the lowest RBC value for human health or 1/5th of the fish or wildlife RBCs. If the RBC is lower than the MRL, than the MRL will be used as the ACG.

^f The MDL for these analytes have not been completed at this time. The MRL may be adjusted based on the calculated MDL.

^g These analytes will be reported to an estimated detection limit (EDL). The EDL is sample and analyte specific and is based on the signal and noise on the instrument.

^h Concentration is for whole fish, and is considered protective of 95 percent of fish species (Steevens et al 2005). Converted from lipid to wet weight assuming 5 percent lipid.

ⁱ The values listed in the MDL column for the PCB Congener analytes represent the average of the EDLs for four method blanks and are not MDLs.

^j Capability to analyze tissues for all of these BDE congeners is uncertain, and will depend on the selected laboratory.

^k Jarvinen et al. (1977).

Table 2-3. Targeted Fish Sampling Locations and Number of Composites

Species	Number of Composite Samples ^a

Kokanee	6F & 6R	6F & 6R	6F & 6R	6F & 6R	6F & 6R	6F & 6R
Total	96	96	96	96	96	96

Notes:

FSCA – Fish Sampling Collection Area

WB – Whole body

F – Fillet

R – Remaining tissue after filleting

* - Gut contents of largescale suckers to be removed prior to analysis of the remainder

^a One well-homogenized composite sample for each tissue type from each species will be used to produce triplicate samples for quality assurance of the

^b At least one composite will be formed for each of the three general feeding guilds - omnivorous, benthic, and insectivorous fish.

^c At least one composite will be formed for each of the three general feeding guilds - omnivorous, benthic, and piscivorous fish.

>30 cm	Primary species	Burbot	otoliths	--
>30 cm	Primary species	Smallmouth bass	otoliths	scales
>30 cm	Primary species	Largescale/Longnose sucker	opercles	scales
>30 cm	Primary species	Rainbow trout	scales	otoliths
>30 cm	Primary species	Kokanee	scales	otoliths
>30 cm	Primary species	Mountain or Lake whitefish	otoliths	scales

Notes:

Preferred and secondary aging structures recommended by the Washington Department of Fish and Wildlife laboratory.

^a <15 cm fish were not aged (see text).

Table 2-6. Summary of Fish Sampling Effort in 2009 by Collection Area

Gear	Primary Target Effort	Sampling Effort by Collection Area						Total
		FSCA 1	FSCA 2	FSCA 3	FSCA 4	FSCA 5	FSCA 6	
Boat electrofishing	12 hrs ^{a, b}	12 hrs	10 hrs	12 hrs	14.5 hrs	15 hrs	13 hrs	76.5 hrs
Backpack electrofishing		2 hrs	0 hrs	0 hrs	1.5 hrs	0.5 hrs	0 hrs	4 hrs
Gill nets	96 hrs ^c	20 net-nights (220 hrs)	35 net-nights (668 hrs)	21 net-nights (457 hrs)	26 net-nights (539 hrs)	19 net-nights (412 hrs)	12 net-nights (258 hrs)	133 net-nights (2554 hrs)
Beach seines	5 hauls or	3 hauls	9 hauls	4 hauls	5 hauls	4 hauls	4 hauls	29 hauls
Minnow traps	8 hrs ^d	15 trap-nights (205 total hrs)	8 trap-nights (180 total hrs)	0	12 trap-nights (234 total hrs)	0	8 trap-nights (168 hrs)	43 trap-nights (787 hrs)
Burbot traps	288 hrs ^e	19 trap-nights (404 hrs)	25 trap-nights (536 hrs)	48 trap-nights (1070 hrs)	65 trap-nights (1379 hrs)	103 trap-nights (2228 hrs)	97 trap-nights (2085 hrs)	357 trap-nights (7702 hrs)
Hoop nets	0 ^f	na	na	na	na	na	4 net-nights (90 total hrs)	90 hrs

Notes:

^a This includes the minimum primary effort for all size classes, additional effort conducted if collection goals not achieved, time permitting.

^b Backpack fishing was an alternative electrofishing method and part of the overall 12 hr minimum sampling effort.

^c Target was 2 12-hr sets with 4 nets per set, equivalent to 96 total netting hours.

^d Target was 8 hrs or 5 seine hauls for beach seines, however, minnow traps were used as an alternative sampling gear for beach seines, targeting small fish.

^e Target was 2 12-hr sets with 12 pots per set, equivalent to 288 total trap hours per FSCA.

^f Hoop nets were not included in the QAPP, this gear was supplied by the Spokane Tribe at FSCA 6 only as a test method.

Notes:

^a UTM Zone 11

** Fish was held on ice and was processed after the 48 hrs period proposed in the 2009 Fish QAPP. No deterioration was noted upon processing, therefore the sample is considered acceptable. When available, only fish processed within the 48 hour period are proposed for analysis.

Notes:

^a UTM Zone 11

** Fish was held on ice and was processed after the 48 hrs period proposed in the 2009 Fish QAPP (TAI 2009). No deterioration was noted upon processing, therefore the sample is considered acceptable. When available, only fish processed within the 48 hour period are proposed for analysis.

Notes:

F – Fillet

R – Remaining tissue after filleting

LN – Longnose sucker

LS – Largescale sucker

mtn – mountain whitefish

FSCA – Fish Sampling Collection Area

WB – Whole body

¹ Not specified in the 2009 Fish Tissue QAPP, however this species falls within this feeding guild and was captured during the field sampling while alternative target species were not.

² Additional individual fillets were also collected for total mercury analysis; the totals are shown in the next table.

Highlighted cells indicate where the sampling goal for the FSCA was not met

Table 3-1. Key to the Sample Identification Codes

FSCA	Field Sample Codes						Composite Sample Codes			
	Species	Size	Number	Capture Method	Composite Samples					
FSCA 1	1	Black crappie	BC	<15 cm	1	1	Electrofishing – backpack	EE	Whole Body	W
FSCA 2	2	Burbot	BU	≥15 to ≤30 cm	2	2	Electrofishing - boat	EB or EF or ED	Fillet	F
FSCA 3	3	Kokanee-hatchery	KOH	>30 cm	3	3	Gill net	GN or N	Remainder	R
FSCA 4	4	Kokanee-wild	KOW			Etc.	Beach seine	SN or SE	Replicate	1 - 6
FSCA 5	5	Lake whitefish	LW				Burbot trap	BT or TF or T	Number of fish in the composite	2 - #
FSCA 6	6	Largescale sucker	LS							
		Longnose dace	LD							
		Mountain whitefish	MW							
		Rainbow trout-hatchery	RBH							
		Rainbow trout-wild	RBW							
		Redside shiner	RS							
		Sculpin sp.	SC							
		Smallmouth bass	SMB							
		Speckled dace	SD							
		Tench	TE							
		Walleye	WE							
Yellow perch	YP									

Notes:

An example of the field sampling coding scheme is as follows. The 52nd fish collected during the 2009 event was a wild rainbow trout of 20 cm in length collected at FSCA 3. The resulting sample ID is 3RBW20052.

Table 4-1. Summary of Rejected and Qualified Data

Notes:

Columbia Analytical Services - Analytical Laboratory Data Qualifiers

<u>Data Flag</u>	<u>Lab Flag Definition</u>
*	This result is an outlier. See case narrative.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
D	The reported result is from a dilution.
E	The result is an estimate amount because the value exceeded the instrument calibration range. For metals, the percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix or chromatographic interference.
J	The result is an estimated value that was detected outside the quantitation range.
J,*	The result is an estimated value that was detected outside the quantitation range. This result is an outlier. See case narrative.
J,N	The result is an estimated value that was detected outside the quantitation range. The Matrix Spike sample recovery is not within control limits. See case narrative.
N	The Matrix Spike sample recovery is not within control limits. See case narrative.
N*	The Matrix Spike sample recovery is not within control limits. See case narrative. This result is an outlier. See case narrative.
P	The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. <i>DOD-QSM 4.1 definition:</i> Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
U,*	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. <i>DOD-QSM 4.1 definition:</i> Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution. This result is an outlier. See case narrative.
U,N	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. <i>DOD-QSM 4.1 definition:</i> Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution. The Matrix Spike sample recovery is not within control limits. See case narrative.

Frontier GeoSciences - Analytical Laboratory Data Qualifiers

<u>Data Flag</u>	<u>Lab Flag Definition</u>
E	The concentration indicated for this analyte is an estimated value above the calibration range of the instrument. This value is considered an estimate (CLP E-flag).
J	Detected but below the Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag)
U	Analyte included in the analysis, but not detected.

Vista Analytical Laboratory

<u>Data Flag</u>	<u>Lab Flag Definition</u>
B	This compound was also detected in the method blank.
D	Dilution
E	The amount detected is above the High Calibration Limit.
EMPC	Estimated Maximum Possible Concentration
P	The amount reported is the maximum possible concentration due to possible chlorinated diphenylether interference.
*	See Cover Letter

Environmental Services, Inc. - Third Party Validation

<u>Validator Flag</u>	<u>Validator Flag Definition</u>
EMPC	Chromatographic peaks are present in the expected retention time window; however, the peaks do not meet all of the conditions required for a positive identification. The detection limit represents the estimated maximum possible concentration if the compound was present.
J	Quantitation is approximate due to limitations identified during the QA review (data validation).
J EMPC	Quantitation is approximate due to limitations identified during the QA review (data validation). Chromatographic peaks are present in the expected retention time window; however, the peaks do not meet all of the conditions required for a positive identification. The detection limit represents the estimated maximum possible concentration if the compound was present.
U	This analyte was not detected at or above the associated detection limit.
U*	This analyte should be considered "not-detected" because it was detected in an associated blank at a similar level.
UJ	This analyte was not detected, but the detection limit is probably higher due to a low bias identified during the QA review.

Notes:

PAHs - polycyclic aromatic hydrocarbons

PCBs - polychlorinated biphenyls

PBDEs - polybrominated diphenylethers

SVOCs - semivolatile organic compounds

TAL - target analyte list for metals, include aluminum, antimony, arsenic, barium, beryllium, cadmium, calcium, chromium, cobalt, copper, iron, lead, magnesium, manganese, mercury, molybdenum, nickel, potassium, selenium, silver, sodium, thallium, vanadium, and zinc.

^a Additional total mercury analyses were conducted on individual fillets from smallmouth bass and walleye, after sufficient number are collected for creating required composites.

^b Inorganic arsenic analysis is important for human health assessments, therefore, speciation is limited to large-sized fish that are likely to be consumed by people.

^c At least one composite will be formed for each of the three general feeding guilds - benthic, invertivorous, and omnivorous fish.

^d At least one composite will be formed for each of the three general feeding guilds - benthic, omnivorous, and piscivorous fish.

Highlighted actual number of samples are less than planned number of samples.

Notes:

ACG - analytical concentration goal, represent the lowest risk-based concentration (RBC) value for human health or 1/5th of the fish or wildlife RBCs. If the RBC is lower than the method reporting limit (MRL), then the MRL will be used as the ACGs.

dw - dry weight

MDL - method detection limit

n/a - not available

TBD - To Be Determined; please note the laboratory determined the Planned MDL for each analyte as required by EPA.

Highlighted values exceed the ACG, and values in red exceed five times the ACG.

-- not analyzed

Notes:

ACG - analytical concentration goal, represent the lowest risk-based concentration (RBC) value for human health or 1/5th of the fish or wildlife RBCs. If the RBC is lower than the method reporting limit (MRL), than the MRL will be used as the ACGs.

MDL - method detection limit

ww - wet weight

Highlighted values exceed the ACG.

-- not analyzed

Notes:
 ACG - analytical concentration goal, represent the lowest risk-based concentration (RBC) value for human health or 1/5th of the fish or wildlife RBCs. If the RBC is lower than the method reporting limit (MRL), than the MRL will be used as the ACGs.
 MDL - method detection limit
 ww - wet weight
 n/a - not available
 Highlighted values exceed the ACG, and values in red exceed five times the ACG.
 -- not analyzed

APPENDIX C

COMPLETED FISH EXAMINATION FORMS

LIST OF TABLES

- C-1. 2009 Fish Examination Codes
- C-2. 2009 Fish Examination Data (Body, Head, Mouth, Eyes, and Opercula)
- C-3. 2009 Fish Examination Data (Gills and Fins)

Table C-1. 2009 Fish Examination Codes

Organ	Code	Definition
Body Surface	BFG	Body fungus
	FDC	Focal discoloration
	HMRB	Hemorrhagic body
	PRST	Parasites
	RGR	Raised growth
	RLSN	Reddened lesion
	SPDF	Spinal deformity
Head/Oral Cavity		
Head	DEF	Deformed
Mouth	ULG	Upper lip growth
	LLG	Lower lip growth
Nare	SLN	Swollen
Barbel (burbot only)	NORM	Normal
Eyes	EMB	Emboli
	EXTH	Exophthalmic
	HMR	Hemorrhagic
	MIS	Missing
	OPQ	Opaque
Opercula	SLSH	Slight shortening
Gills	FRAY	Frayed
	MRGN	Marginate
	PALE	Pale
Fins	ERS	Erosion
	FRAY	Frayed
	HMR	Hemorrhagic
	EMB	Emboli
