1 INTRODUCTION

This report presents the results of the 2016 hatchery white sturgeon tissue study (herein referred to as the study) conducted by CH2M HILL (CH2M) on behalf of the U.S. Environmental Protection Agency (EPA) and Teck American Incorporated (TAI) for the Upper Columbia River (UCR) Site, herein referred to as the Site.¹ The study was planned to determine if the consumption of hatchery white sturgeon collected from the Site would result in human health risks. White sturgeon have been identified as a traditional tribal food source and common sport fish in the Columbia River, but they were not sampled as part of the 2009 fish tissue sampling study, because they were not part of a legal fishery at the Site during the course of that study (SRC 2016). Survival rates and abundance of hatchery white sturgeon at the Site are much higher than anticipated, and this has prompted plans for targeted removal of hatchery white sturgeon in order to prevent the dilution of genetic diversity in the wild sturgeon population (SRC 2016). The preferred approach to removing hatchery white sturgeon is to establish recreational and subsistence fisheries and to distribute hatchery sturgeon collected during targeted removals to tribal memberships and local food banks. Before hatchery white sturgeon can be considered safe for human consumption, fish tissues need to be evaluated to determine if their consumption poses human health risks (SRC 2016).

Sampling and analyses were conducted as described in the quality assurance project plan (QAPP) for the study prepared for the EPA (SRC 2016). The QAPP for the study is Addendum No. 1 to the QAPP for the 2009 fish tissue study (Parametrix et al. 2009). This study was conducted as part of the remedial investigation and feasibility study (RI/FS) for the Site. The objective of the study was to supplement the original data quality objectives (DQOs) of the 2009 fish tissue study by providing data that could be used to evaluate potential exposure to chemicals of interest (COIs) by people consuming hatchery white sturgeon from the Site.

To meet the study objective, hatchery white sturgeon tissue samples were collected during a population stock assessment and subsequently analyzed. Tissue samples were collected from fish caught by the Lake Roosevelt fisheries sampling team, comprised of the Confederated Tribes of the Colville Reservation (CCT) and Spokane Tribe of Indians (STI). The population stock assessment was conducted in areas extending from Inchelium/Gifford to the U.S.-Canada border (Reaches 1 through 4 of the UCR Site), which is where the vast majority of hatchery white sturgeon are distributed (Stroud et al. 2012; as cited in Environment International 2016). A subset of fish caught by the Lake Roosevelt fisheries sampling team was

¹ The Site, as defined in the June 2, 2006, Settlement Agreement (USEPA 2006), is “the areal extent of hazardous substances contamination within the United States in or adjacent to the Upper Columbia River, including the Franklin D. Roosevelt Lake (“Lake Roosevelt”), from the border between the United States and Canada downstream to the Grand Coulee Dam, and all suitable areas in proximity to such contamination necessary for implementation of the response actions....”

given to EPA for tissue collection and analysis. Although the population stock assessment took place throughout Reaches 1 through 4 of the UCR Site, the hatchery white sturgeon tissue samples were obtained from fish caught in areas where hatchery white sturgeon were thought to be abundant (Reaches 2, 3, and 4 of the UCR Site). Composites of white sturgeon filets representing three different size classes of fish were analyzed for the following: conventional parameters, concentrations of common target analyte list (TAL) metals/metalloids identified as COIs in the 2009 human health risk assessment (HHRA) work plan (SRC 2009), and concentrations of organic chemicals that the Washington Department of Health (WDOH) had determined were of concern in updating fish advisories for the UCR. Each size class was represented by three replicate composites consisting of eight fish filets. The size classes were defined as 50 to 97, 98 to 137, and 138 to 160 cm. Fish tissue sampling activities for this study were performed between August 30 and September 13, 2016.

1.1 STUDY PURPOSE AND DATA QUALITY OBJECTIVES

The DQO process summarized in the QAPP (SRC 2016) identified an approach for filling a data gap regarding the characterization of potential risk associated with the consumption of hatchery white sturgeon from the UCR Site by humans. As part of the DQO process, the goals of the study were identified.

The primary goals of the study were:

- To provide information to be used in the HHRA to determine whether contaminants in hatchery white sturgeon tissue in the UCR Site pose an unacceptable risk to human health; and
- To provide data required by WDOH to evaluate the need for a fish advisory for white sturgeon.

1.2 REPORT ORGANIZATION

This report is organized into the following sections:

- **Section 1—Introduction.** This section provides background information, identifies the purpose of the study, and outlines the organization of the report.
- **Section 2—Study Design and Methods.** This section describes the study design and sampling locations, the methods used for collecting fish tissues, the methods used for compositing fish tissues, and the methods used for conducting field and laboratory analyses.
- **Section 3—Quality Assurance Project Plan Modifications and Deviations.** This section discusses modifications to and deviations from the QAPP.
- **Section 4—Validation Assessment.** This section provides a summary of the validation assessment of the analytical results of the study samples.

- **Section 5—Results.** This section presents a summary of the analytical results.
- **Section 6—Summary.** This section presents a summary of the study.
- **Section 7—References.** This section presents bibliographic information for the documents cited in this report.

Figures, maps, and data tables are provided following Section 7. Data tables presented herein have been provided in electronic format, including raw data (provided on CD-ROM). Data may also be obtained directly from the project database, accessible at: <http://teck-ucr.exponent.com>.

2 STUDY DESIGN AND METHODS

This section summarizes the study design and methods (including field collection and laboratory methods). Additional details of the study plan are presented in the QAPP (SRC 2016).

2.1 STUDY DESIGN

The 2016 white sturgeon tissue sampling study targeted locally abundant hatchery white sturgeon to provide data to support the HHRA. The CCT and STI fisheries personnel performed a stock assessment of hatchery white sturgeon from reaches 1 through 4 during August and September 2016. During the stock assessment, hatchery white sturgeon from reaches 2 through 4 were provided to CH2M/EPA personnel for filleting of tissues prior to chemical analysis.

The following sections provide details on the white sturgeon size classes, tissue types analyzed, sample locations, analyte list and methods, sampling effort and collection methods, biological measurements, and sample compositing. Additional details on the study design and its implementation are presented in Section B of the QAPP (SRC 2016) and in the field summary report (FSR; Appendix A). Details regarding the fillet compositing plan are presented in Appendix B.

2.1.1 White Sturgeon Size Classes

Three size classes of hatchery white sturgeon were targeted to provide representative data on COI concentrations in hatchery white sturgeon of the various sizes that are targeted for removal. Hatchery white sturgeon with a 50- to 160-cm fork length (FL) are being targeted for removal because of concerns over the potential reduction in genetic diversity of white sturgeon in the UCR (SRC 2016). Offspring of relatively few parents comprise the majority of hatchery white sturgeon, which outnumber the wild sturgeon population (SRC 2016). The Lake Roosevelt Fishery Co-Managers have recommended reducing the abundance of hatchery white sturgeon produced from adult broodstock crosses completed prior to 2010 (McLellan 2016). The size range of fish targeted for removal (i.e., 50- to 160-cm FL) is based on the minimum and maximum lengths of hatchery white sturgeon from the selected brood years that have been caught in previous monitoring efforts (SRC 2016). The three size classes selected within this size range were defined as follows:

- 50 to 97 cm (A—small)
- 98 to 137 cm (B—medium)
- 138 to 160 cm (C—large).

The medium size class (B) was selected based upon the current fishery downriver from the Bonneville Dam to The Dalles Dam (38 to 54 inches [in.], e.g., 97 to 137 cm). The small and large size classes (A and C) were selected to determine if hatchery white sturgeon could be provided to tribal members or food banks after the targeted removal of the hatchery white sturgeon of the selected brood classes (i.e., brood years 2001 to 2010).

2.1.2 Tissue Type

Fillets with skin removed were collected from hatchery white sturgeon. Because sturgeon skin is generally considered inedible, fillets without skin best represent human exposure via consumption. Composite samples of the fillets were prepared according to the sample compositing plan described in Section 2.1.7 and Appendix B.

2.1.3 Sample Locations

The hatchery white sturgeon stock assessment extended from Inchelium/Gifford to the U.S.-Canada border (Reaches 1 through 4 of the UCR Site). However, the sturgeon tissue samples for this study were obtained from fish caught in Reaches 2, 3, and 4 of the UCR Site. Fillets from individual fish were collected from river mile (RM) 684 to RM 723 (Map 2-1). This is the area in which the majority of hatchery white sturgeon are distributed (Stroud et al. 2012; as cited in Environment International 2016).

The average spatial location of each composite sample (calculated by averaging the RM associated with each individual fillet of a composite) is shown on Maps 2-2 to 2-10.

2.1.4 Analyte List and Methods

Planned target analytes as defined in the QAPP (SRC 2016) are presented in Table 2-1. Analytical procedures used for this study were standard EPA-approved analytical protocols (Table 2-2) with detection limits sufficiently low to provide concentration data that are below risk-based benchmarks when possible (Table 2-1). Analytical laboratory procedures for analysis of polychlorinated biphenyl (PCB) congeners, dioxins/furans, and polybrominated diphenylethers (PBDEs) were performed by Vista Analytical Laboratory. All other analytical laboratory procedures, including tissue homogenization, compositing, and analysis, were performed by ALS Environmental (ALS).

2.1.5 Sampling Effort and Collection Methods

Hatchery white sturgeon were collected by Lake Roosevelt fisheries sampling team personnel (CCT and STI) via set lining, and whole or partially dissected sturgeon were provided to CH2M for processing. The Lake Roosevelt fisheries sampling team recorded the global

positioning system (GPS) coordinates (latitude and longitude) where fish were collected (i.e., point coordinates for set lines).

Sampling was performed by one field team consisting of CH2M and EPA personnel. For the first week, the team consisted of one CH2M field team lead, one CH2M sampling staff, and one EPA representative. CH2M performed all duties and responsibilities for sample preparation, sample collection, and sample handling. EPA staff reviewed and approved sampling changes/deviations, and supported CH2M with sampling. For the remainder of the sampling event, the team consisted of one CH2M field team lead and one CH2M sampling staff.

Sample pick-up and processing was conducted on boats provided by the National Park Service (NPS) from August 30 through September 7, 2016, and by Columbia Navigation on September 8, 9, and 13, 2016.

A total of 72 hatchery white sturgeon were sampled during the 2016 field sampling effort. The length and weight of each fish, as well as other field collection and fillet processing information is provided in the FSR (Appendix A).

Fish Collection and Handling

All hatchery white sturgeon were measured for fork length (cm) and weighed (kg) by the Lake Roosevelt fisheries sampling team upon retrieval from the set lines. Wild white sturgeon were returned to the water alive. The hatchery white sturgeon were euthanized using a sharp blow to the head with a decontaminated mallet or club, being careful not to break the skin of the fish. Fish were also scanned with a passive integrated transponder (PIT) tag reader to determine brood year.

Specimens of hatchery white sturgeon that met the size class requirements for tissue sampling were transferred to CH2M for tissue sample processing. Prior to transfer of fish from the Lake Roosevelt fisheries sampling team, internal organs (stomachs and gonad tissue) of some fish were removed for use in separate studies (Appendix A provides additional details). The Lake Roosevelt fisheries sampling team provided CH2M with the PIT tag identification (ID), fish brood year, length, and weight of each fish at the time fish were transferred.

Tissue Sample Processing

All tissue processing was performed on the boat operated by the NPS or Columbia Navigation. The processing boat either traveled to shore and fish processing was conducted on the boat while beached to provide a stable platform, or if calm water permitted, fish were processed while the boat floated in water deeper than 50 feet (ft). The tagged fish were held in decontaminated plastic tubs prior to processing.

Fish were photographed and examined for external abnormalities, filleted with skin removed, and at least 200 ± 20 g wet weight (ww) of fillet was collected, wrapped in foil, labeled², double-bagged in re-sealable plastic bags and placed in a cooler on ice. For fish in the C size class, 400 g of fillet was collected for some samples because there was a concern that there would not be a sufficient number (i.e., 24) of C size class hatchery white sturgeon caught during the sampling effort. During filleting, no internal organs were punctured. As previously noted, some fish were received with stomach or gonad tissue removed for separate studies. According to CCT and STI fisheries personnel, removal of the organs did not impact the white sturgeon tissue that was sampled because the incisions were small relative to the overall size of the fish and not in the part of the fish that was filleted and sampled.

Equipment Decontamination

The field team thoroughly rinsed all sampling equipment that came into contact with fish between samples and upon completion of the study.

Rinsing was performed using river water away from the shoreline and any areas where sediment had been disturbed during beaching of the boat. Equipment used for processing the fish was washed with soap (i.e., Alconox™) and rinsed with river water after each use. Cleanroom 100 certified nitrile gloves used for handling fish were discarded, not decontaminated. Clean gloves were worn when handling each fish to avoid transfer of potential contaminants among samples. This equipment decontamination procedure deviates from that described in the QAPP in that methanol and nitric acid rinses were not performed due to lack of availability at the sampling locations (i.e., shipping issues).

Fish Identification Numbering

Individual fish were identified with the letters “EPA,” a species abbreviation, brood year, a sequential number, and a composite bin/replicate identifier (e.g., EPA-HS-01-001-A1). Individual fish ID codes included the following information:

- Species = Hatchery White Sturgeon (HS)
- Brood year designated as follows
 - 2001 = 01
 - 2002 = 02
 - 2003 = 03
 - 2004 = 04
 - 2005 = 05
 - 2006 = 06

² Field sample labels included the task name, sample location, fish number, CH2M sampler initials, analyses to be performed, and sample date and time.

- 2007 = 07
- 2008 = 08
- 2009 = 09
- 2010 = 10
- Sequential fish number expressed as three digits, starting with 001 (e.g., 001 or 002)
- Composite bin identifier
 - A = 50 to 97 cm
 - B = 98 to 137 cm
 - C = 138 to 160 cm
- Composite bin replicate number 1, 2, or 3³.

The example fish identifier code EPA-HS-01-001-A1 represents a hatchery white sturgeon from the 2001 brood year that was the first fish selected by the Lake Roosevelt fisheries sampling team for tissue sampling, and in the first group of the 50- to 97-cm size class. Ultimately, the composite bin replicate numbers were not used for assigning individual fish to replicate composites for each size class.

2.1.6 Sample Compositing

A plan for compositing individual sturgeon tissue samples into size class-specific composites was developed after the field sampling program was complete. The original compositing plan described in the QAPP, which indicated that fish tissues would be composited by reach, was not used. The compositing plan, detailed in a letter from EPA to TAI on September 30, 2016 (Appendix B), consisted of a stratified random approach based on fork length in each size class. The locations where fish assigned to each composite sample were caught are shown on Maps 2-2 through 2-10.

ALS prepared the fillet composites by combining equal masses of individual homogenized fillets. The composites were then homogenized and subsampled for analysis. Homogenates from the individual fillets were archived at the laboratory. Any remaining homogenized composite sample material was discarded.

³ The individual fish ID applied in the field designated a composite replicate number, but the field-assigned composite replicate number was not ultimately used for determining compositing in the laboratory.

3 QUALITY ASSURANCE PROJECT PLAN MODIFICATIONS AND DEVIATIONS

This section provides a description of deviations from the 2016 QAPP and field sampling plan (FSP), and how these changes affect the quality of data.

3.1 DEVIATIONS FROM QAPP AND FSP

Two deviations from the QAPP and FSP occurred during the field event due to unanticipated conditions. The changes to field sampling procedures were approved by EPA personnel present between August 30 and September 2, 2016. Copies of the field change forms are presented in the FSR (Appendix A) and summarized below.

- Modification to equipment decontamination. The FSP called for a methanol and nitric acid rinse of fish processing equipment. Shipping of these materials to the sampling site was delayed because methanol and nitric acid are considered hazardous substances. As a consequence, these chemicals did not arrive in a timely manner. As a modification, field equipment used for processing the fish was washed with soap (i.e., Alconox™) and rinsed with deionized water and site water prior to the start of sampling each day. In addition, the field team used river water to thoroughly rinse all sampling equipment that came into contact with fish after each use and upon completion of the study.
- Modification to sample packaging. Dry ice was not available during the first week of sampling. As a consequence, samples were packaged and shipped using wet ice during that time. Wet ice was double-bagged in resealable plastic bags, and coolers were lined on the top and bottom with ice to ensure that samples remained at temperature during shipping.

In addition to the above-mentioned modifications, EPA provided oversight during only the first week of tissue collection, and not during the entire tissue collection event. Also, the QAPP states that the CH2M/EPA processing team was to receive whole fish, but some fish were received partially dissected. The level of oversight and the sample handling procedures for these fish were not specified in the QAPP or in the FSR.

None of the modifications described herein are anticipated to adversely affect the quality of the data collected during the 2016 white sturgeon tissue study.

4 VALIDATION ASSESSMENT

Data validation was performed by Environmental Standards, Inc. (ESI) of Valley Forge, Pennsylvania, in accordance with the QAPP (SRC 2016) and based on EPA guidance from applicable analytical methods and the following documents:

- *Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use* (EPA 540-R-08-005) (USEPA 2009)
- *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review* (EPA 540-R-013-001) (USEPA 2014a)
- *USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review* (EPA 540-R-014-002) (USEPA 2014b)
- *USEPA Contract Laboratory Program National Functional Guidelines for Chlorinated Dibenzo-p-Dioxins (CDDs) and Chlorinated Dibenzofurans (CDFs) Data Review* (EPA 540-R-11-016) (USEPA 2011).

Stage 4 validation was conducted for all data. Data were qualified, as needed, based on an evaluation of the following quality control (QC) criteria:

- Holding times
- Condition of samples upon laboratory receipt
- Sample preparation
- Initial and continuing calibrations
- Blank results
- Matrix spike/matrix spike duplicates (MS/MSDs) results
- Laboratory control sample (LCS) results
- Laboratory duplicate and triplicate results
- Ongoing precision and recovery (OPR) standard results
- Mass tuning
- Labeled compound recoveries
- Reporting limit (RL) standard results
- Interference check sample results
- Post-digestion spike results
- Serial dilution results
- Internal standard performance
- Instrument sensitivity
- Retention times
- Analytical sequence and quantitation of positive results.

The ESI data validation report is provided in Appendix C and is also available on the Downloads page of the project database (<http://teck-ucr.exponent.com>). The results of the data validation for overall data quality of chemistry results; sample transport and holding times; and equipment blank data, inorganic tissue data, and organic tissue data are summarized in Sections 4.1, 4.2, and 4.3 through 4.5, respectively.

4.1 OVERALL DATA QUALITY

Chemistry data for equipment rinsate blanks and fish tissues meet quality requirements in accordance with the QAPP (SRC 2016). A summary of the qualifiers assigned to equipment blank and tissue results is presented in Tables 4-1 and 4-2, respectively. No data were rejected and all data are usable with the qualifiers presented. The following data qualifiers were applied by ESI:

- Estimated maximum possible concentration (EMPC)—Chromatographic peaks were present in the expected retention time window; however, the peaks did not meet all of the conditions required for a positive ID. The detection limit represents the maximum possible concentration if the analyte was present.
- J—The concentration was considered estimated due to one or more of the following conditions: concentration was between the detection limit and the reporting limit, extraction standard recovery was either low or high, or the result exceeded instrument calibration range.
- U—The analyte was not detected at or above the method detection limit (MDL) for inorganics or the estimated detection limit (EDL) for organics.
- U*—The analyte was considered not detected because a similar concentration was detected in an associated blank sample. ESI considered sample weight, percent solids, and dilution factor when evaluating blank contamination. For results qualified as U*, the detection limit was changed to the concentration of the qualified result.

Data quality indicators for precision, accuracy or bias, representativeness, completeness, and comparability (PARCC) were specified in the 2016 QAPP addendum (SRC 2016) and measurement quality objectives (MQOs) were listed in Table B-4 of the 2009 fish tissue QAPP (Parametrix et al. 2009). The data validator used the project-specific MQOs to evaluate sturgeon tissue data for the quantitative components of PARCC (i.e., precision and accuracy or bias). Duplicate relative percent differences and triplicate relative standard deviations were used to assess precision. The evaluation of accuracy and bias was based on the results of QC samples such as matrix spikes, internal standards, and

equipment and method blanks. The data validator also assessed sample handling, laboratory methods, and holding times to evaluate the representativeness and comparability of analytical data. Data were qualified as necessary by ESI when MQOs were not met. A data completeness goal of 95 percent was specified in the QAPP (Parametrix et al. 2009). Data completeness was 100 percent for all analyte groups.

The following sections discuss the data review findings and reasons qualifiers were applied by the data validator. Laboratory QC samples (i.e., laboratory duplicate and triplicate samples) were included in the validation assessment, and are, therefore, also indicated in the qualifier counts below. Tables 4-1 and 4-2 show both the number of qualifiers applied by the analytical laboratory and the number of qualifiers applied by the data validator. These sections also summarize the data validation results for sample transport and holding times, equipment blanks, and tissue data.

4.2 SAMPLE TRANSPORT AND HOLDING TIMES

The caps on the containers for samples EPA-HS-A1 DUP and EPA-HS-B2 were broken upon receipt at Vista Analytical. The jars and samples were uncompromised and no data were qualified due to this issue.

4.3 EQUIPMENT BLANK DATA

This section summarizes equipment blank concentrations and data qualifiers for equipment blank results. Data qualifiers are summarized in Table 4-1. Qualifiers were added to equipment blank data by ESI based on an evaluation of QC factors such as laboratory blank concentrations and ion abundance ratios.

Because the equipment blanks were liquid (rinse water) and the samples analyzed were a solid matrix (tissue), equipment blank concentrations were converted to the same units as the tissue data in order to evaluate contamination. Equipment blank concentrations did not warrant the qualification of any tissue results.

The first equipment rinsate blank created by ALS (Homogenization Blank 10/17/16) contained limited volume and was not analyzed for PCB congeners. Subsequent rinsate blanks were created with enough volume for all target analyte groups.

The only qualifiers applied to equipment blank results were due to ion abundance ratios. Rinsate blank concentrations were qualified as EMPC due to out of control ion abundance ratios for the following analytes and numbers of samples:

- Octachlorobiphenyl homologs – 1
- PBDE-47 – 1
- PBDE-99 – 1
- PBDE-153 – 1
- PCB-16/32 – 1
- PCB-18 – 2
- PCB-20/21/33 – 1
- PCB-28 – 2
- PCB-31 – 2
- PCB-43 – 2
- PCB-61/70 – 1
- PCB-95/98/102 – 1
- PCB-110 – 1
- PCB-194 – 1
- Pentachlorobiphenyl homologs – 1
- Total tetra-bromodiphenyl ether (BDE) – 1
- Trichlorobiphenyl homologs – 1.

4.4 INORGANIC TISSUE DATA

This section summarizes data quality issues for inorganic tissue results, including laboratory duplicate and triplicate samples as qualified by ESI based on an evaluation of various QC factors (e.g., LCS and MS recoveries, laboratory blank concentrations, and laboratory duplicate and triplicate results). Data qualifiers are summarized in Table 4-2.

The only qualifiers applied to inorganic tissue results were due to method or calibration blank contamination. Tissue concentrations were qualified as non-detected (U* flagged) due to the presence of the analyte in an associated blank for the following analytes and numbers of samples (numbers of laboratory QC samples⁴ qualified are shown in parentheses):

- Aluminum – 3
- Antimony – 8 (3)
- Silver – 3 (3).

4.5 ORGANIC TISSUE DATA

This section summarizes the number of organic tissue results qualified by ESI, including laboratory duplicate and triplicate samples. Data qualifiers are also summarized in

⁴ Laboratory duplicate and laboratory triplicate samples.

Table 4-2. Qualifiers were applied as needed based on an evaluation of various QC factors (e.g., calibration and extraction standard recoveries and laboratory blank concentrations). Organic tissue data were qualified due to calibration, method blank, ion abundance ratio, and extraction standard results, as detailed in the subsections below. All other QC parameters were within control limits.

4.5.1 Calibration

Tissue concentrations were qualified as estimated (J flagged) due to results exceeding the instrument calibration range for PBDE-47 in nine samples and two laboratory QC samples.

4.5.2 Blanks

Tissue concentrations were qualified as non-detected (U* flagged) due to the presence of the analyte in an associated method blank for PCB-11 in nine samples and two laboratory QC samples.

4.5.3 Ion Abundance Ratios

Tissue concentrations were qualified as EMPC due to out of control ion abundance ratios for the following analytes and numbers of samples (numbers of laboratory QC samples qualified are shown in parentheses):

- 1,2,3,7,8-pentachlorodibenzofuran (PeCDF) – 4
- 2,3,4,7,8-PeCDF – 4
- 2,3,7,8-tetrachlorodibenzofuran (TCDF) – 0 (1)
- Monochlorobiphenyl homologs – 3
- Octachlorodibenzodioxin – 2
- PCB-1 – 3
- PCB-3 – 4
- PCB-4/10 – 2
- PCB-6 – 2
- PCB-34 – 1 (2)
- PCB-40 – 1 (1)
- PCB-46 – 1
- PCB-50 – 1
- PCB-54 – 1
- PCB-55 – 1
- PCB-67 – 1 (1)
- PCB-77 – 1
- PCB-94 – 1
- PCB-103 – 0 (1)
- PCB-145 – 1
- PCB-150 – 1 (1)
- Total PeCDF – 4
- Total TCDF – 0 (1)
- Total di-BDE – 2.

4.5.4 Extraction Standards

Tissue concentration was qualified as estimated (J flagged) due to low extraction standard recoveries for total tetra-BDE in one sample.

Tissue concentrations were qualified as estimated (J flagged) due to high extraction standard recoveries for the following analytes and numbers of samples (numbers of laboratory QC samples qualified are shown in parentheses):

- Total hepta-BDE – 0 (1)
- PBDE-99 – 2
- Total penta-BDE – 2
- Total hexa-BDE – 2.

5 RESULTS

This section summarizes the sturgeon tissue results and analytical concentration goal (ACG) screens for each analyte group. A total of nine sturgeon fillet composites representing three sturgeon size classes were analyzed for metals, conventional parameters (i.e., fluoride, lipid content, and total solids), dioxins/furans, PCB congeners, and PBDEs.

Summary statistics for all COIs are presented in Tables 5-1, 5-2, and 5-3 for small (50 to 97 cm), medium (98 to 137 cm), and large (138 to 160 cm) hatchery white sturgeon fillet composites, respectively. Chemical concentration data are summarized on a dry weight basis for metals and on a wet weight basis for organic chemicals, as reported by the laboratory. This also facilitates comparison with ACGs. In addition, tissue concentration data for metals are summarized on a wet weight basis (Table 5-4) to facilitate comparisons with previously reported data. Prior to summarizing tissue concentration data for metals on a wet weight basis, reported tissue concentration data were converted from a dry weight basis to a wet weight basis for each composite using this equation: wet weight concentration = dry weight concentration*percent solids/100. Percent solids was measured for each composite sample and is reported in the project database. The chemical concentration data are also shown by size class in Figures 5-1 through 5-5. ACGs were compared to actual method reporting limits (MRLs) for non-detected inorganics results and to EDLs for non-detected organics results, as summarized in the following sections and in Tables 5-5 through 5-8.

5.1 TARGET ANALYTE LIST METALS/METALLOIDS AND CONVENTIONAL PARAMETERS

All composite fillet samples were analyzed for the following metals/metalloids and conventional parameters: aluminum, antimony, total arsenic, inorganic arsenic, barium, beryllium, boron, cadmium, calcium, chromium, cobalt, copper, fluoride, iron, lead, magnesium, manganese, mercury, molybdenum, nickel, potassium, selenium, silicon, silver, sodium, sulfur, thallium, tin, uranium, vanadium, zinc, lipid content, and total solids. Summary statistics for all COIs and conventionals are presented in Tables 5-1 through 5-3. Tissue concentrations for metals are also summarized in Table 5-4 on a wet weight basis. Figures 5-1a through 5-1d and 5-2a through 5-2c show metal/metalloid and conventional results, respectively, for each sturgeon fillet composite by size class.

ACG, planned MRLs, and actual MRLs for metals/metalloids and conventional parameters are shown in Table 5-5. Actual MRLs were compared to ACGs for

non-detected results, and the only exceedances were for inorganic arsenic. None of the inorganic arsenic results (n = 9) were detected, and the actual MRL was four times the ACG of 0.02 mg/kg. Actual MRLs were below the ACG for all other non-detected results.

5.2 DIOXINS/FURANS

All composite fillet samples were analyzed for dioxin/furan congeners. Summary statistics for dioxins/furans and calculated mammalian toxic equivalents (TEQs) and congener sums are presented in Tables 5-1 through 5-3. Figures 5-3a and 5-3b show total and dioxin TEQ⁵ concentrations for each sturgeon fillet composite by size class.

ACGs, planned MDLs, and toxic equivalency factor (TEF)-adjusted EDLs for dioxins/furans and dioxin-like congeners are shown in Table 5-6. EDLs were weighed by the appropriate mammalian TEF from Van den Berg et al. (2006) and compared to the ACG. There were no ACG exceedances for non-detected dioxins/furans or dioxin-like congeners.

5.3 POLYCHLORINATED BIPHENYLS

All composite fillet samples were analyzed for PCB congeners. Summary statistics for PCB congeners and the calculated sum of total PCB congeners are presented in Tables 5-1 through 5-3. Figures 5-4a and 5-4b show total PCB congener and PCB TEQ⁶ concentrations for each sturgeon fillet composite by size class.

ACGs, planned MDLs, and EDLs for PCB congeners are shown in Table 5-7. ACGs for individual PCB congeners were presented in the QAPP (Parametrix et al. 2009), and an ACG for total PCB congeners was presented in the QAPP (SRC 2016). EDLs were compared to ACGs and there were no ACG exceedances for non-detected PCBs.

⁵ Dioxin TEQ was calculated by summing the products of the concentration of each of the 17 individual dioxin/furan congeners and its specific TEF from Van den Berg et al. (2006). Total TEQ was calculated by summing the products of the concentration of each of the 17 individual dioxin/furan congeners and the 12 individual dioxin-like PCB congeners and its specific TEF from Van den Berg et al. (2006). Congeners that were undetected for a given sample were assigned a value equal to one-half the sample-specific DL for use in the TEQ calculation.

⁶ PCB TEQ was calculated by summing the products of the concentration of each of the 12 individual dioxin-like PCB congeners and its specific TEF from Van den Berg et al. (2006). Congeners that were undetected for a given sample were assigned a value equal to one-half the sample-specific DL for use in the TEQ calculation.

5.4 POLYBROMINATED DIPHENYLEETHERS

All composite fillet samples were analyzed for PBDEs. Summary statistics for PBDEs are presented in Tables 5-1 through 5-3. Figures 5-5a through 5-5n show PBDE concentrations for each sturgeon fillet composite by size class.

ACGs, planned MDLs, and EDLs for PBDEs are shown in Table 5-8. EDLs were compared to ACGs and there were no ACG exceedances for non-detected PBDEs.

6 SUMMARY

Consistent with the QAPP (SRC 2016), 72 individual fish fillet samples were composited into 9 samples representing 3 different size classes of hatchery white sturgeon and were analyzed for COIs. The targeted number of hatchery white sturgeon was obtained for chemical analysis. All samples were analyzed for COIs appropriately and in accordance with the QAPP (SRC 2016). For inorganic COIs, all samples had detected concentrations or non-detected MRLs that met the ACGs, with the exception of inorganic arsenic. All samples had inorganic arsenic concentrations that were non-detected, and the MRL was higher than the ACG. For organic COIs, all EDLs were below associated ACGs. As part of the data validation assessment, no data were rejected and all data are considered usable with the qualifiers presented.

Notes:

BDE - bromodiphenyl ether
PBDE - polybrominated diphenylether
PCB - polychlorinated biphenyl
Data qualifiers:

Laboratory

B The compound was also detected in the method blank.
EMPC Estimated maximum possible concentration
J The result is an estimated value that was detected outside the quantitation range.
J, B The result is an estimated value that was detected outside the quantitation range. The compound was also detected in the method blank.
U The analyte was analyzed for, but was not detected at or above the method reporting limit/method detection limit (MRL/MDL).

Validator

EMPC Chromatographic peaks are present in the expected retention time window; however, the peaks do not meet all of the conditions required for a positive identification. The detection limit represents the maximum possible concentration if the analyte was present.
J Quantitation is approximate due to limitations identified during the QA review (data validation).
U This analyte was not detected at or above the associated detection limit.
U* This analyte should be considered non-detected because it was detected in an associated blank at a similar level.

Notes:

^a Qualifier counts do not include laboratory quality control samples

BDE - bromodiphenyl ether

PBDE - polybrominated diphenylether

PCB - polychlorinated biphenyl

Data qualifiers:

Laboratory

- B The compound was also detected in the method blank.
- B, E The compound was also detected in the method blank. The associated compound concentration exceeded the calibration range for the instrument.
- EMPC Estimated maximum possible concentration
- J The result is an estimated value that was detected outside the quantitation range.
- U The analyte was analyzed for, but was not detected at or above the method reporting limit/method detection limit (MRL/MDL).

Validator

- EMPC Chromatographic peaks are present in the expected retention time window; however, the peaks do not meet all of the conditions required for a positive identification. The detection limit represents the maximum possible concentration if the analyte was present.
- J Quantitation is approximate due to limitations identified during the QA review (data validation).
- U This analyte was not detected at or above the associated detection limit.
- U* This analyte should be considered non-detected because it was detected in an associated blank at a similar level.

Notes:

Summary statistics were calculated using half the reporting limit for non-detected inorganic results and half the estimated detection limit for non-detected organic results.

BDE - bromodiphenyl ether

DL - detection limit

NA - not applicable

PBDE - polybrominated diphenylether

PCB - polychlorinated biphenyl

SD - standard deviation

TEQ - toxicity equivalence quotient

Notes:

Summary statistics were calculated using half the reporting limit for non-detected inorganic results and half the estimated detection limit for non-detected organic results.

BDE - bromodiphenyl ether

DL - detection limit

NA - not applicable

PBDE - polybrominated diphenylether

PCB - polychlorinated biphenyl

SD - standard deviation

TEQ - toxicity equivalence quotient

Notes:

Summary statistics were calculated using half the reporting limit for non-detected inorganic results and half the estimated detection limit for non-detected organic results.

BDE - bromodiphenyl ether

DL - detection limit

NA - not applicable

PBDE - polybrominated diphenylether

PCB - polychlorinated biphenyl

SD - standard deviation

TEQ - toxicity equivalence quotient

Notes:^a ACGs are from the QAPP (SRC 2016)^b Planned MDLs are from the QAPP (SRC 2016). Note that planned MDLs are provided for informational purposes only and are not equivalent to EDLs, which are sample-specific.^c TEFs are for mammals from Van den Berg et al. (2006) per the QAPP (SRC 2016)

ACG - analytical concentration goal

EDL - estimated detection limit

MDL - method detection limit

NA - not applicable

ND - non-detected result

PCB - polychlorinated biphenyl

TEF - toxic equivalence factors

Table 5-7. Comparison of ACGs to EDLs for PCB Congeners

Introduction

This Field Summary Report (FSR) describes the procedures and methods that the field team used to collect sturgeon tissue samples during the 2016 Sturgeon tissue sampling effort, and provides summary information and details regarding sample locations, sample quality assurance/quality control (QA/QC), and known deviations from the field sampling plan included as an appendix to Addendum No. 1 to the Quality Assurance Project Plan for the 2009 Fish Tissue Study and Appendix A-1 Field Sampling Plan - Upper Columbia River Sturgeon Tissue Study (Fish QAPP Addendum – Sturgeon) (SRC, 2016a). This work was conducted in August and September 2016 by CH2MHill (CH2M) on behalf of the U.S. Environmental Protection Agency (EPA) at the Upper Columbia River (UCR) Site (Site)¹ in Washington.

The primary objective of the 2016 sturgeon tissue sampling effort is to collect information on the concentrations of UCR chemicals of interest (COIs) in hatchery white sturgeon tissues (fillets) from three size classes collected in the upper portion of the UCR Site. The 2016 sturgeon tissue sampling effort is one of the tasks that will support the remedial investigation and feasibility study (RI/FS) that is being conducted by Teck American Incorporated (TAI) for the Site. This information will be used to support the human health risk assessment (HHRA) that will be conducted as part of RI/FS for the Site. The HHRA will be completed by the EPA, and the remaining RI/FS tasks will be completed by TAI, with EPA oversight.

1.1 Background

The 2009 Fish Tissue QAPP (Parametrix et al. 2009) identified white sturgeon as a traditional tribal food source and common sport fish in the Columbia River. White sturgeon were not sampled in 2009 as they were not part of a legal fishery in the UCR at the time. Long-term monitoring of hatchery white sturgeon in the UCR from the Grand Coulee Dam upstream to the Hugh L. Keenelyside Dam in Canada has shown that survival rates and abundance of these fish are much greater than anticipated (Golder 2015, as cited in McLellan 2016). As a result, the Upper Columbia White Sturgeon Recovery Initiative (UCWSRI) and the Lake Roosevelt Fishery Co-Managers are planning targeted removal of hatchery white sturgeon to avoid diluting the genetic diversity present in wild sturgeon. The preferred removal approach is to establish recreational and subsistence fisheries in the UCR, along with targeted removal of specific cohorts, with distribution of euthanized hatchery white sturgeon to Tribal membership and local food banks (McLellan 2016). Prior to making these fish available for human consumption, hatchery white sturgeon need to be evaluated to determine whether their consumption would result in human health risks. These data are needed for both the UCR HHRA and to support Washington Department of Health (WDOH) in their review of the potential need for a UCR sturgeon fish consumption advisory.

1.2 Document Organization

This report is organized into the following sections:

- **Section 1** – Introduction. This section provides background information for the study and outlines the report organization.
- **Section 2** – Study Description. This section describes the purpose and objectives of the study and provides an overview of the study design.
- **Section 3** – Field Activities. This section identifies the methods used to collect the UCR sturgeon samples and discusses any changes or deviations from the QAPP and field sampling plan (FSP).

¹ The Site is located wholly within Washington State and includes the portion of the UCR extending from the U.S.-Canadian border to Grand Coulee Dam, including Franklin D. Roosevelt Lake (Lake Roosevelt), and the areal extent of related contamination within the United States adjacent to the UCR.

- **Section 4** – References. This section presents bibliographic information for the documents cited within this report.
- Figures and data tables are provided following Section 4.

Field records and supporting information for the UCR sturgeon sampling are provided in Appendix A and B. Field change forms are provided in Appendix C. Lake Roosevelt Fisheries Co-manager field records are provided in Appendix D.

Study Description

2.1 Purpose of Study

The purpose of the 2016 sturgeon sampling event was to collect white sturgeon tissue to fill a data gap related to the assessment of risk to humans from the consumption of sturgeon. This section presents a brief overview of the study design.

2.2 Study Design

The basis of the study design for the 2016 Sturgeon sampling was detailed in the QAPP Addendum – Sturgeon (SRC, 2016b). Fish tissue samples were obtained from hatchery white sturgeon caught by the Confederated Tribes of the Colville Reservation (CCT) and Spokane Tribe of Indians (STI) as Lake Roosevelt Fisheries Co-Managers² as part of a population stock assessment. Approximately 700 fish were expected to be captured during the fall 2016 stock assessment effort based on previous white sturgeon surveys with a subset given to EPA for tissue collection and analysis. Only hatchery fish were to be retained for possible tissue sample collection (wild fish represented 5 to 10 percent of the total catch during previous stock assessments).

The stock assessment was conducted in areas extending from Inchelium/Gifford to the U.S.-Canadian border (Reaches 1 through 4 of the UCR Site), which is where the vast majority of hatchery white sturgeon are distributed (Environment International [EI] 2016). Telemetry data show some sturgeon move substantially among the river reaches (SRC, 2016b) and indicate substantial variability in the range of movement among individual sturgeon. Therefore, the sturgeon tissue samples were not collected and composited by river reach, as was done in the 2009 fish sampling effort (Parametrix et al. 2009). Lake Roosevelt Fisheries Co-Manager personnel used baited set lines placed in a spatially balanced random sampling design (SRC 2016b) to conduct the stock assessment.

Although the stock assessment took place throughout Reaches 1 through 4 of the UCR Site, the sturgeon tissue samples were obtained from fish caught in areas where hatchery sturgeon were thought to abundant (Reaches 2 and 3 of the UCR Site).

Fish from brood years 2001-2010, expected to be abundant throughout the UCR, were targeted for tissue collection. The targeted length range was 50 to 160 cm fork length [FL] [20-63 inches] (EI 2016).

2.2.1 Composite Samples

Although compositing of sturgeon was not necessary to achieve the mass of tissue required for analysis due to their large size (DOE 2008), the sturgeon tissue samples were to be composited to increase the likelihood of producing data with sufficiently low variability. EPA requested a minimum of 72 hatchery white sturgeon from the Lake Roosevelt Fisheries Co-Managers. This recommended minimum number of samples was sufficient to increase the number of fish per composite from 5 (per the 2009 sampling event) to at least 8 fish (resulting in 9 composite samples of 8 fish each). The increase to 8 fish per composite was designed to reduce variability among the sturgeon composite data, relative to the 2009 data, and therefore to increase reliability of 95% upper confidence limits on estimates of mean concentrations (UCL95).

Sturgeon tissue composites were to be grouped based on three fish sizes: 50-97 cm (A class), 98-137 cm (B class), and 138-160 cm (C class). Table 1 shows the number of composite samples per size range. As noted in

² The Washington Department of Fish and Wildlife (WDFW) is also a Lake Roosevelt Fisheries co-manager. However, the WDFW did not participate in 2016 sturgeon stock assessment field activities.

Section 3.4, the method for assigning tissue samples to different size class composite groups was developed after tissue sampling was complete and consisted of a stratified random approach.

2.2.2 Chemical Analyses

The suite of chemicals for analysis in fish tissues included conventional parameters (total length and mass, percent moisture, percent lipid), common target analyte list (TAL) metals/metalloids identified as COIs in the 2009 HHRA work plan (USEPA 2009), total inorganic arsenic and total arsenic, polychlorinated dibenzo-p-dioxins and furans (i.e., 17 dioxin-like congeners [USEPA 2010]), polychlorinated biphenyls (PCBs) (PCB congeners [209 forms]) and total PCBs (dioxin-like and non-dioxin-like PCBs), and polybrominated diphenyl ethers (PBDEs) (total PBDEs, BDE-47, BDE-99, BDE-153, and BDE-209).

SECTION 3

Field Activities and Methods

The 2016 sturgeon sampling effort was outlined in the EPA-approved Fish QAPP Addendum - Sturgeon and detailed in Appendix A-1 of the addendum (Field Sampling Plan - Upper Columbia River Sturgeon Tissue Study). Sampling was conducted by CH2M personnel.

This section discusses the methods and procedures used during the 2016 sturgeon tissue sampling event. Field sampling activities were conducted from August 30 to September 13, 2016. All field activities and sample collection methods were performed in accordance to the EPA-approved QAPP and FSP unless otherwise noted in Section 3.3.

3.1 Fish Sampling

Hatchery white sturgeon were collected by Lake Roosevelt Fisheries Co-Managers (CCT & STI) via set lining and whole sturgeon were provided to CH2M for processing. The Lake Roosevelt Co-Manager sampling team recorded the global positioning system (GPS) coordinates (latitude and longitude) where fish were collected (i.e., point coordinates for set lines).

Sampling was performed by one field team consisting of CH2M and EPA personnel. For the first week, the team consisted of one CH2M Field Team Lead (FTL), one CH2M sampling staff, and one EPA representative. CH2M performed all duties and responsibilities for sample preparation, sample collection, and sample handling. EPA staff reviewed and approved sampling changes/deviations, and supported CH2M with sampling. For the remainder of the sampling event, the team consisted of one CH2M Field Team Lead and one CH2M sampling staff (Table 2). A field safety audit was conducted by the CH2M Health and Safety Manager on September 8, 2016.

Sample pick-up and processing was conducted on boats provided by the National Park Service (NPS) from August 30 through September 7, 2016 and by Columbia Navigation on September 8, 9, and 13, 2016.

A total of 72 hatchery white sturgeon were sampled during the field effort. The chronology for sample collection activities is summarized in Table 3.

3.1.1 Equipment

Field equipment and supplies for the CH2M fish processing team included fish filleting equipment, decontamination supplies, sample containers, coolers, shipping containers, logbooks and forms, personal protective equipment (cut-resistant gloves), and personal gear. Nitrile gloves were also worn while filleting and handling sturgeon tissue samples to minimize the possibility of cross-contamination between fish.

Sample containers were clearly labeled at the time the tissue samples were taken from the caught hatchery sturgeon. Labels included the task name, sample location and number, CH2M sampler's initials, analyses to be performed, and sample date and time.

3.1.2 Fish Sizes

Sturgeon tissue composites were grouped based on three fish sizes: 50-97 cm, 98-137 cm, and 138-160 cm. Each size group had 24 hatchery white sturgeon collected for a total of 72 fish. The 24 fish for each size group were divided into 3 composite samples, each with 8 individual fish per composite (Table 1).

3.1.3 Fish Collection Locations

Figure 1 shows the locations recorded by the Lake Roosevelt Fisheries Co-Manager sampling team where the sturgeon transferred to CH2M for tissue sampling were caught (i.e., point coordinates for set lines). These coordinates are listed, along with the fish identification numbers in Table 4.

3.1.4 Fish Collection and Handling

All sturgeon were measured for FL (cm) and weighed (kg) by the Lake Roosevelt Fisheries Co-Managers upon retrieval from the set line. Wild sturgeon were returned to the water alive. The hatchery white sturgeon were euthanized using a sharp blow to the head with a decontaminated mallet or club, being careful not to break the skin of the fish. Fish were also scanned with a passive integrated transponder (PIT) tag reader to determine the brood year.

Specimens of hatchery white sturgeon that met the size class requirements for tissue sampling were transferred to CH2M for tissue sample processing. Prior to transfer of fish from the Lake Roosevelt Fisheries Co-Managers, internal organs (stomachs and gonad tissue) of some fish were removed for use in separate studies, as indicated in Table 5. The Lake Roosevelt Fisheries Co-Managers provided CH2M with the PIT tag ID, fish brood year, length and weight at the time the fish was transferred (Table 5).

3.1.5 Sample Tissue Processing

All processing was performed on the boat operated by the NPS or Columbia Navigation. The processing boat either traveled to shore and fish processing was conducted on the boat while beached to provide a stable platform, or if calm water permitted, fish were processed while the boat floated in water deeper than 50 ft. The tagged fish were held in decontaminated plastic tubs prior to processing.

Fish were photographed and examined for external abnormalities, filleted with skin removed, and at least 200 g (+/- 20 g) of fillet was collected, wrapped in foil, double-bagged in resealable plastic bags and placed in a cooler on ice. For fish in the C size class 400 g of fillet was collected for some samples because there was a concern that there would not be 24 C class sturgeon caught during the sampling effort. During filleting, no internal organs were punctured. As mentioned in Section 3.1.4, some fish were received with stomachs or gonad tissue removed for separate studies. According to CCT and STI fisheries personnel, removal of the organs did not impact the sturgeon tissue that was sampled because the incisions were small relative to the overall size of the fish and not in the part of the fish that was fileted and sampled. Table 5 shows individual fillet weights and sample weights for each fish and indicates fish that were received with internal organs removed.

3.1.6 Equipment Decontamination Procedures

The field team thoroughly rinsed all sampling equipment that came into contact with fish between samples and upon completion of the study.

Rinsing was done using river water away from the shoreline and any areas where sediment had been disturbed during beaching of the boat. Equipment used for processing the fish was washed with soap (i.e., Alconox™) and rinsed with river water after each use. Cleanroom 100 certified nitrile gloves used for handling fish were discarded, not decontaminated. Clean gloves were worn when handling each fish to avoid transfer of potential contaminants among samples.

Note that the procedures identified above deviate from those identified in Standard Operating Procedure (SOP) 2 for decontamination of sampling equipment in that methanol and nitric acid rinses were not used because of issues with shipment of these chemicals, which are considered hazardous materials. More information about this deviation is provided in Section 3.3.

3.1.7 Sample Numbering

Individual fish were identified with the letters “EPA”, a species abbreviation, brood year, a sequential number, and composite bin/replicate identifier (ID) (e.g., EPA-HS-01-001-A1). The codes included the following information:

- Species = Hatchery sturgeon (HS)
- Brood year designations were as follows:
 - 2001 – 01

- 2002 – 02
 - 2003 – 03
 - 2004 – 04
 - 2005 – 05
 - 2006 – 06
 - 2007 – 07
 - 2008 – 08
 - 2009 – 09
 - 2010 – 10
- Sequential fish numbers were expressed as three digits starting with 001 (e.g., 001 or 002).
 - Composite bins were:
 - A = 50-97 cm
 - B = 98-137 cm
 - C = 138-160 cm

With sequential numbering for the replicates for the size class (i.e., 1 through 3)

Therefore, the example EPA-HS-01-001-A1 would have been a hatchery sturgeon, from the 2001 brood year, the first fish that was processed, and in the first group of the 50-97 cm size bin. Note that the group numbers were not used for assigning individual samples to composites (see Section 3.4).

3.1.8 Field Documentation

All sampling and associated field activities were documented on activity-specific field forms, field logbooks, and digital photographs.

3.1.8.1 Field Logbook

Daily field activities were documented through journal entries in a bound field logbook by the field team lead for the duration of the sturgeon sampling effort. The field logbooks contain all pertinent information about staff present, site arrival and departure times, health and safety pre-task meetings, sampling activities, site conditions, field methods, site sketches, general observations, and other pertinent technical information. Field book entries followed general accepted professional standards and procedures described in the FSP. The field logbooks and sampling records are part of the permanent project record and are provided in Appendix B. Lake Roosevelt Fisheries Co-managers field records are provided in Appendix D.

3.1.8.2 Digital Photographs

Digital photographs were taken during sampling activities to document sampling procedures, site locations and conditions, and other pertinent activities. Photographs were taken of each sturgeon. A dry-erase white board bearing the sample name, date and time, was held in the photograph for reference. The photo number and description of the photograph were entered sequentially into the Photo Log, which is included in Appendix A. The photographs are part of the permanent project record and have been scanned and saved in the project folder.

3.1.8.3 Dedicated Field Forms

All sampling and associated activities were documented on activity-specific field forms. The field forms contained information and data specific to each sturgeon. Completed field forms are provided in Appendix B, and a brief description of each form is provided below.

- **Sturgeon Tracking Log:** Sample ID and date collected
- **Daily Field Collection Form:** Sample ID, date, time, pit tag number, photo location, weight of fillet, weight of sample for composite, and collector's initials

- **Sturgeon External Examination Form:** Sample ID, date, time, weight, length, species and any abnormalities in the following: body surface, eyes, head, opercula, fins, barbels, and gills.

3.1.8.4 Waste Disposal

After processing of the sturgeon tissue, the carcass was resected into two pieces to ensure the swim bladder and other organs were punctured. The carcass and unused fillet tissue was then sunk in the deeper channel of the reservoir.

Limited waste was produced during 2016 sturgeon sampling effort. During decontamination of equipment, an Alconox and distilled water mixture was generated and reserved in a bucket until returning to the Kettle Falls boat launch after each day at which time it was disposed of into the facility's septic system. All general refuse (such as gloves, paper towels, plastic bags) was disposed of in the dumpster at the Kettle Falls boat launch.

3.2 Sample Handling and Custody

The following section describes the handling, storage, and shipment procedures for samples collected for 2016 sturgeon sampling effort. All samples remained in the custody of CH2M, in a locked freezer, or with the transportation courier at all times until delivery to the analytical laboratory. Custody procedures for the sampling event were in accordance with the FSP.

3.2.1 Sample Storage

All samples were temporarily stored on ice in a cooler immediately after collection. For the first week of sampling, due to the unavailability of dry ice, samples were stored on wet ice and locked in a field team member's hotel room until packing and shipping with the courier. The following week, samples were frozen on dry ice and stored in an upright, locked freezer at Columbia Navigation until time of packaging. The freezer key was given to CH2M, and the Columbia Navigation warehouse was locked and secured with an alarm system.

3.2.2 Sample Management

All samples were packaged and labeled for shipment in compliance with the chain of custody procedures described in the FSP. A list of the samples collected by the field team, including the sample date and time, was provided to the off-site sample manager on a sample tracking sheet at the end of each field day. The sample manager used the sample tracking sheet and Scribe sample management software to generate permanent sample labels and chains-of-custody (COCs) for the samples. The labels and COCs were produced and sent to the field manager to affix to the sample containers. Each Scribe label and COC was checked against the list of sample IDs provided on the sample tracking sheet, and again against the temporary label on the sample container to ensure each container was properly label. Clear plastic tape was placed over each Scribe label to protect the label from damage. The labeled samples and COCs were placed in coolers with ice for shipment to the analytical laboratory. Following shipment of samples to the analytical laboratory, the required Scribe sample management documentation was submitted to the EPA via the sample management office (SMO) portal and the laboratory was notified of the shipment.

3.2.3 Sample Transportation

Spokane Courier Service (SCS) of Spokane was hired to transport the samples directly to the ALS analytical laboratory located in Kelso, Washington. Three courier trips were used to ship samples to the lab during the sampling event.

Samples were in the custody of SCS until they were hand-delivered to ALS. For one of the shipments, SCS picked the samples up in Colville in the evening and stored the vehicle at the SCS facility overnight to allow for earlier departure the following morning, thus ensuring samples arrived to the laboratory during business hours. CH2M discussed proper security, storage of the vehicle, and handling with SCS for the time period and confirmed the vehicle was locked and then parked in a secured, locked, indoor facility at SCS until the

driver returned in the early hours the following day to drive the samples to ALS. For two of the shipments, the samples were dropped off with SCS in Spokane and the same procedure was followed.

Samples were delivered to ALS and custody was transferred from the courier driver to the lab.

3.3 Field Sampling Modifications and QAPP/FSP Deviations

Modifications and deviations to sampling procedures occurred during the field event due to unforeseen conditions. It was anticipated that some changes would be required in the field so a protocol was established to address and approve significant changes to the sampling effort. All changes to sampling procedures were approved by EPA personnel present August 30-September 2, 2016 and were recorded in the field logbook and on Field Change forms. Examples of such changes include the following:

- **Modification to equipment decontamination.** SOP-2 called for a methanol and nitric acid rinse of fish processing equipment. However, shipping was delayed because methanol and nitric acid are considered hazardous materials, and the chemicals did not arrive in a timely manner. Therefore, field equipment used for processing the fish on board was washed with soap (i.e., Alconox™) and rinsed with deionized water and site water prior to the start of sampling each day. The field team thoroughly rinsed all sampling equipment that came into contact with fish between samples and upon completion of the study.
- **Modification to sample packaging.** Dry ice was not available during the first week of sampling. Therefore, samples were packaged and shipped using wet ice. Wet ice was double-bagged in resealable plastic bags and coolers were lined on the top and bottom with ice to ensure samples remained at temperature during shipping.

Copies of the Field Change forms are provided in Appendix C.

3.4 Sturgeon Tissue Composite Assignments

A plan for compositing individual sturgeon tissue samples into size class-specific composites was developed after the field sampling program was complete. The compositing plan, detailed in a letter from EPA to TAI on September 30, 2016, consists of stratified random approach based on fork length in each size class. Table 6 lists the fish sample assignments for each composite.

CH2MHILL

Pre-Task Safety Plan (PTSP) and Safety Meeting Sign-in Sheet

Project: WCR Sturgeon Sampling Location: Kettle Falls Date: 9/10/16
 Supervisor: David Resman Job Activity: Sturgeon Sampling

Attendees:	Print Name	Sign Name
	<u>David Resman</u>	<u>[Signature]</u>
	<u>Kelly Orland</u>	<u>[Signature]</u>

List Tasks and verify that applicable AHAs have been reviewed:
Travel on boat, working on water, collecting sturgeon, processing/filleting sturgeon, placing samples on wet & dry ice, delivery of samples to courier service

Tools/Equipment Required for Tasks (ladders, scaffolds, fall protection, cranes/rigging, heavy equipment, power tools):
Boat, life jackets, fire extinguisher, cutting board, bins, buckets, scales, knives, water down equipment, scrub brush & alumid

Potential H&S Hazards, including chemical, physical, safety, biological and environmental (check all that apply):

<input type="checkbox"/> Chemical burns/contact	<input type="checkbox"/> Trench, excavations, cave-ins	<input checked="" type="checkbox"/> Ergonomics
<input checked="" type="checkbox"/> Pressurized lines/equipment	<input checked="" type="checkbox"/> Overexertion	<input checked="" type="checkbox"/> Chemical splash
<input type="checkbox"/> Thermal burns	<input checked="" type="checkbox"/> Pinch points	<input checked="" type="checkbox"/> Poisonous plants/insects
<input checked="" type="checkbox"/> Electrical	<input type="checkbox"/> Cuts/abrasions	<input checked="" type="checkbox"/> Eye hazards/flying projectile
<input checked="" type="checkbox"/> Weather conditions	<input checked="" type="checkbox"/> Spills	<input type="checkbox"/> Inhalation hazard

Pre-Task Safety Plan (PTSP) and Safety Meeting Sign-in Sheet

Project: DOR 670774.RT.07 Location: Kettle Falls Date: 9/13/16
Supervisor: Marilyn Gauthier Job Activity: Sturgeon Tissue Sampling

Attendees:	Print Name	Sign Name
	<u>Kelly O'Neal</u>	<u>[Signature]</u>
	<u>Marilyn Gauthier</u>	<u>[Signature]</u>

List Tasks and verify that applicable AHAs have been reviewed:
Travel + work on water
cutting fish (knives)
ice on equipment

Tools/Equipment Required for Tasks (ladders, scaffolds, fall protection, cranes/rigging, heavy equipment, power tools):
Boat ice life jackets, fire extinguisher, knives, cut proof gloves, first aid kit, alouca

Potential H&S Hazards, including chemical, physical, safety, biological and environmental (check all that apply):

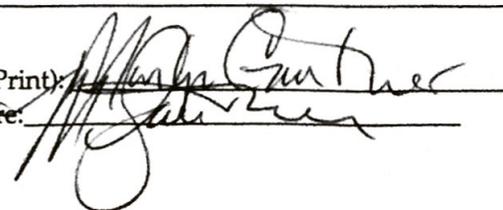

<input type="checkbox"/> Chemical burns/contact	<input type="checkbox"/> Trench, excavations, cave-ins	<input checked="" type="checkbox"/> Ergonomics
<input checked="" type="checkbox"/> Pressurized lines/equipment	<input checked="" type="checkbox"/> Overexertion	<input checked="" type="checkbox"/> Chemical splash
<input type="checkbox"/> Thermal burns	<input checked="" type="checkbox"/> Pinch points	<input checked="" type="checkbox"/> Poisonous plants/insects
<input checked="" type="checkbox"/> Electrical	<input checked="" type="checkbox"/> Cuts/abrasions	<input checked="" type="checkbox"/> Eye hazards/flying projectile
<input checked="" type="checkbox"/> Weather conditions	<input checked="" type="checkbox"/> Spills	<input type="checkbox"/> Inhalation hazard
<input type="checkbox"/> Heights/fall > 6 feet	<input type="checkbox"/> Overhead Electrical hazards	<input checked="" type="checkbox"/> Heat/cold stress
<input type="checkbox"/> Noise	<input type="checkbox"/> Elevated loads	<input checked="" type="checkbox"/> Water/drowning hazard
<input type="checkbox"/> Explosion/fire	<input checked="" type="checkbox"/> Slips, trip and falls	<input type="checkbox"/> Heavy equipment
<input type="checkbox"/> Radiation	<input checked="" type="checkbox"/> Manual lifting	<input type="checkbox"/> Aerial lifts/platforms
<input type="checkbox"/> Confined space entry	<input type="checkbox"/> Welding/cutting	<input type="checkbox"/> Demolition
<input type="checkbox"/> Underground Utilities	<input type="checkbox"/> Security	<input checked="" type="checkbox"/> Poor communications

Field Notes (including observations from prior day, etc.):

Name (Print): _____
 Signature: 

Date: 9/13/16

0730 - meet Kathy Cerise/EPA @ Celville
+ drive to Kettle Falls boat launch

0800 - met Megan
Justin
Olivia

Weather: 70-90°F
pt. cloudy. light
wind.

Math/CCT - survey boat

Denise - data

Hank - captain

Roger - deckhand

CCT + Spokane boats will be pulling
& resetting ~1000 lines with 40
hooks per line - checked 2c/day
= 800 hooks. | Safety: boating

from Marcus to Dalles. (See form)

0930 - CCT boat with sturgeon
at Marcus campground.

11:14 Fish ID EPA HS-07-003-B1
+ Stomach content - gritty, snails

1230 3 fileps collected.

EPA HS 08 001 B1

10 002 A1

07 003 B1

1340

03 004 C1

Location UCR Date 8/16 53
Project / Client Sturgeon Sampling 083016

1400 @ CET Boat N. of Evans

· v. Large Sturgeon (pics)

· 198 tag - wild

8' long

103 Kg

L, W, Blood, DNA cell by CCT
& released.

1446 EPAHS 09006 A1

· is very fatty.

meas @ 3' 8" length but

CCT assigned to A1 and

87.9 cm length

* confirm length class

* reassign - to A2.

seems that fish 006 & 007

tags were reversed -

based on wt + LN measures

reported. Switched

006 → A2

007 → A1

- Dumped carcasses mid. channel
& they sank

1600 head back to KF Marina
from Bossburg area.

To Do upon return

- dry ice / bag ice
- ✓ labels → scribe → bags
- coes (print after get pdf from scribe)
- ✓ data entry
- sharpen knives
- PIT tag reader codes

* 530 = 1730 @ hotel after
getting ice - only wet ice
no dry ice @ walmond

only ships on Tues + they didn't
receive any this week.

- * - ship - courier 2x/week on
wet ice?

Druckman cc'd KC on email

emails / calls to Frank + MG, to
ID change management.

083016

0730 Meet Kathy + depart for Kettle Falls

0800 @ Kettle Falls boat launch to meet NPS:

Megan + Justin

Safety briefing - deer road hazards + sharps (see form)

0930 Met up with CCT Sturgeon boat at Marcus.

Weather: pt. cloudy + 70°F
light wind

2 sturgeon received from CCT: Hank, Denise, Roger.

Processed 9 fish COC

Project / Client Sturgeon Sampling

13:07 - Hank told us next week they
will be fishing furs - Sat but
will not have any fish for us until
Wednesday (9/7)

- NPS staff? for boat?
- need WA boating license
to operate if Cit needs
→ down here staff
- weather man.

1520 Completed processing
the 8 fish

1600 Back at Kettle Marina.
Kathy, Car & Rachel
to check out North Area
of the site - BSB & DME.

1800 Back at Colville

~~090116
Car~~

Location UCR Date 090216
 Project / Client Sturgeon Sampling

0745 Depart Colville for Kettle
 Marina. Weather: pt. cloudy
 60°F; high of 70 expected.
 rain passed over last night.
 may get more today.

0810 @ Kettle Falls Marina
 met Kirk Holliday / NPS
 Kathy C. / EPA
 w/ Cam Irvine / CH
 + Kelly O'Neal / CH

CCT: Hank, Denise, Roger.

- Going to N. gorge + work
 Dams. only 6 sets to pull

Safety topic. bee stings. saw some
 yellow jackets at filet
 stations (on boat where we
 processed fish) yesterday.
 Banned in FAKit.

0852 Cougar in water, dead
 + bloated just N. of Marcus
 en route to first line pull. ^{oo}
photos

0924 - Q caught at N. Gorge

Field Change Forms

FIELD CHANGE REQUEST

Page 1 of 1 Field Change No.: 1 Project Number: 670274.FI.02

Project Name: White Sturgeon Tissue Sampling: Upper Columbia River Site CERCLA RI/FS

CHANGE REQUEST

Applicable

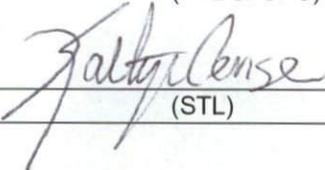

Reference: Quality Assurance Project Plan. Upper Columbia River Sturgeon Tissue Study Addendum No. 1 to the Quality Assurance Project Plan for the 2009 Fish Tissue Study

Description of Change: Replace acid/solvent decontamination of sample processing tools with scrubbing with Alconox® at the beginning of each day, followed by DI rinse, and site water rinse/scrub between fish.

Reason for Change: Unavailability of decontamination chemicals at the beginning of sampling.

Impact on Present and Completed Work: No impact expected. Teflon cutting surface and stainless steel knives are not a significant source of potential contamination.

Requested by:  Date: 09/18/16
(FTL or SPC)

Project Name: White Sturgeon Tissue Sampling: Upper Columbia River Site CERCLA RI/FS

CHANGE REQUEST

Applicable

Reference: Quality Assurance Project Plan. Upper Columbia River Sturgeon Tissue Study Addendum No. 1 to the Quality Assurance Project Plan for the 2009 Fish Tissue Study

Description of Change: Tissue storage on dry ice and shipping once a week may be revised in the field to storage on wet ice and shipping to the lab twice each week on wet ice. Tissues stored and shipped on wet ice would be received by the analytical lab within approximately 48 hours after collection.

Reason for Change: Unavailable/ inconsistent supply of dry ice locally.

Impact on Present and Completed Work: No impact expected.

 WS = white sturgeon; NP = Northern Pike/minnow; BB = Burbot
 R = alive and released; S = sacrificed; D = dead at capture
 L = left ray; R = right ray; B = both rays; N = neither ray

DISP (disposition)
 R = alive and released; S = sacrificed; D = dead at capture

PECT (pectoral fin ray)
 L = left ray; R = right ray; B = both rays; N = neither ray

SCUTE SCARS/REMOVED e.g., 1R,3R 1,2,3 RAD/LAD (right/left anterior dorsal fin origin)

PIT
 Y = present/applied (record number in provided box) N = not present/not applied
 Y = present S = scar N = none

EXTAG (external tag)
 Y = yes (describe in comments) N = no deformities
 Y = applied N = Not applied

DEFOM (Deformity)
 Y = fin tissue collected (record label ID) N = no sample
 Y = Stomach collected N = Stomach not collected

OTC (25mg/kg)
 Y = fin tissue collected (record label ID) N = no sample
 Y = Stomach collected N = Stomach not collected

DNA
 Y = Stomach collected N = Stomach not collected

STOMACH
 Y = Stomach collected N = Stomach not collected

RE: Hatchery White Sturgeon Fillet Compositing Approach

Dear Ms. McCaig,

Please see the enclosed tables that show the compositing approach for the hatchery white sturgeon fillets. The composites were determined using a stratified random approach, based off of sturgeon fork length. There are eight individual sturgeon in each composite. The twenty four sturgeon in each size class were first sorted by fork length. Then the smallest three sturgeon were randomly assigned composite number 1, 2, or 3. This was repeated in sets of three. There is an inconsistency in the Individual Fish ID and the Fish Composite ID. The Individual Fish ID assigned a composite in the field but this should not be used. Please use the Composite Number column, which correctly corresponds to the Fish Composite ID.

As stated in the QAPP, each individual fillet will be homogenized first, then the same mass from each of the eight fillets will be combined to make a composite. The composite will then be homogenized and subsampled for analysis. The homogenates from the individual fillets must be archived at the laboratory. Since there will be enough of the original fillet left over to repeat all analysis if needed, the leftover composite samples may be discarded.

If you have any questions, please contact me at 509-376-5466 or buelow.laura@epa.gov.

Sincerely,

A handwritten signature in cursive script, appearing to read "Laura C. Buelow".

Laura C. Buelow
Project Manager
